I'm not sure, but I don't think so... I think the TT030 and Falcon has SCSI
ports, but the Mega STe has the standard Atari DMA port... :)

Hi John! AFAIK, the easiest way to do it is to buy the kit that is available
just for this purpose and includes everything you need. I'd try some of the
Atari dealers for current pricing (Toad, Computer Direct, Best Electronics,
ATY, System Solutions, etc,...). I don't think you have to upgrade the TOS,
your friends is TOS 2.05 instead of 2.06, I take it? Hope this helps! :)

The ST uses the standard voltages - +5, +12, common ground. The
original PSU should have the voltages silk-screend on the circuit
board, which makes it easy to see what goes where. I've used various
substitute supplies for STs over the years; an old 520ST "brick" is
perfect, of course.

What version of TOS does he have now, John? DIP switch #7 will enable
the high density option on the format menu (even if the hardware can't
handle it) for TOS 2.05 or 2.06; any PC-standard 1.44 floppy drive
will work, although you may need to exchange the ribbon cable for a
"twisted" one from a PC. The AJAX chip is recommended, but a hefty
heat sink and possibly a CPU cooling fan will let the stock chip work
for a good while if it's a 1772-02. Keep a 720k disk in the drive
when HD isn't needed and the heat will stay low.

>Perhaps I'm wrong...

No, the TT has a SCSI port as does the Falcon. The MSTe has only a
DMA port externally, and the internal host can handle only one drive
unless you hack a special cable. The Link II or Link 96 is the best
option, along with a Mac-ready external drive.

Hi everyone,

I'm still looking for a possibility to connect my Falcon to a BNC or UTP network, using tcp/ip or something. I've heard there does exist a BNC-network-adapter for the Falcon and it should be from Germany, but I'm not able to find any network-adapter. Anyone having suggestions, please react.

I'm kind off new in this news-group, so I will introduce myself shortly. I'm a electronics-student at the university of Twente in Holland. My Atari is a Falcon030, 14MB RAM, 2.1GB SCSI-2 HDU, 4*speed CD-ROM, all this in 19" Wizztronics Falcon Rack.

Greetings, EJ

1737. Please help: Power supply broken

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-30 00:00:00 UTC
From: rebridso@undergrad.math.uwaterloo.ca
Message-ID: <EAzwru.752@undergrad.math.uwaterloo.ca>
Source record: 16872

I recently shipped my agin 1040STFM to Waterloo. First problem was that the replacement floppy I had hacked in didn't want to stop spinning -- so I opened the case and found the drive cables weren't fully plugged in. After turning it back over, things got worse: the thing wouldn't turn on. I found a loose wire from the AC connector to the power supply and soldered it back on. But this didn't change the behaviour:

When I turn it on, nothing happens -- the power light doesn't even go on -- except that the power supply emits a very high pitched (upper limit of my hearing) sound. When I turn the switch off, the pitch quickly drops and then stops.

I'm assuming there's something wrong with the power supply, and that it isn't just a loose connection. Does anyone have advice?

Alternatively, how much does an old ST go for second-hand these days? (in Canada!)

Robert Bridson -- rebridso@undergrad.math.uwaterloo.ca

Technically, that's not quite accurate. /NO/ hard disk will autoboot
until it has been partitioned and had the proper boot software
installed. Older drives usually require formatting as well (MFM and
RLL drives, usually).

The machine came with TOS 2.05, but I had a set of 2.06 around that I installed. I attempted to change the DIP #7, which allowed the OS to format at 1.44meg, but the drive must not be high density. We do have a high density drive (although some case cutting will be necessary) and would prefer not to buy a floppy kit for $100 when the computer only cost $170. Does anyone know what else is contained in the kit, and whether it is possible to upgrade with our own floppy and a purchased Ajax?

j> to 1.44meg. Will an AJAX chip and TOS upgrade be necessary?

If the floppy controller is a WD1772-02-02 then it *may* run successfully with an HD floppy (but may not). If not, then an Ajax will be necessary, obviously.

The TOS should be fine because I think there were only TOS 2.05 and 2.06 versions ever released (not TOS 2.01 which wouldn't have supported HD floppies properly). 2.05 and 2.06 will be fine AIUI.

The Mega STe only has an external ACSI port. The TT has bot ACSI and SCSI 1.

Karl,

I don't know of any drivers for this scanner and yes it does
matter. Currently the only drivers that I know to be available for
Atari's are for certain models of Mustek scanners, the Epson
1000 (and maybe other models), the HP scanners and the
Microtek ScanMaker E-6 model.

The best monitors to use are the Atari ones. Atari made three? mono
monitors, the SM124, SM125 and the SM144.

It is possible to wire certain PC VGA and nearly all SVGA monitors for
this purpose with a special lead, although you need to check things
like monitor frequencies. To be useful as a mono monitor, it must be
able to scan at 31kHz horizontally and 70Hz vertically. Often this
information is displayed on a sticker on the back.

If you want the lead information, then contact me by email.

Mark.

I think upgrade kits would be a waste of money for you, they're designed
for people whose STs weren't designed for HD floppies. Get any PC HD
floppy and replace it for your current one. It should read 720K disks
fine without any twiddling. If it appears not to work, twist the
ribbon cable connector 180degrees, it should then work. If you're lucky,
you can swap the facade from your old internal drive with your new
drive. That fixes the case cutting problem which looks less pretty on
a MSTE than wedge-style ST cases. I picked up an Ajax chip (though it
was about 3 years ago now) when I did the rest of the drive upgrade,
so I can't say how reliable the old chips are if you don't replace them,
but there was some rumour or another that if your chip number ended in
-02-02 then it should be quite happy.

the hatter

1753. Help: RS-422 to RS-232?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-01 00:00:00 UTC
From: pahartik@sci.fi
Message-ID: <5mt0lc$8fj@idefix.eunet.fi>
Source record: 16888

I've got a cable, bought from a Macintosh store. Cable has plug that fits nicely to the 8 pin Mini-DIN socket on Falcon030. On other end there is D25 connector that can be plugged to modem.

The cable is supposed to be used between Macintosh and a modem. I can't use it with a modem because it acts pretty weird. Data gets transferred correctly but it's _slow_. Maybe because DTR (I think) signal keeps dropping all the time. When using CoNnect, for example, the title of the terminal window keeps blinking and the time counter falls back to zero.

What can I do to get over this strange behaviour? Is it even possible to fix this by rearranging the wires?

Thanks for any help.

6-1-97 >>>>>> [][] ATARI Clearence SALE [][] <<<<<< 6-1-97

I have accumulated quite a bit of atari stuff! I didn't realize it was
that much until I moved into my new place, and found I didn't have room
:) So it's time to thin out the less used items.

Item : Complete System
Computer : Mega 4 w/ 4mb RAM and TOS 1.04
Monitors : Monochrome * AND * Color w/ Monitor master
Monitor Models : SM124 and Goldstar SC1224 w/ manuals
Software : Over 100 original games (100's of disks?) plus misc.
Comments : utils. Also includes joysticks, a mouse ...
Comments : 2400 baud external modem and the mega4 has the original
box and manual!

Includes whatever programming manuals/software that I might have that
you want. In short, if you want more (asside from the Hard Drive) w/o
paying more, (FROM MISC AREA ONLY) I'll pry throw it in
(depending on what it is)

Asking : $275 + shipping

Item : Complete External Hard drive setup
Host Type : ICD Link
Megabytes : 139mb formated
Type Case : Plus Impulse flat case
approx size: 13(width) 2.5(height) 14.5(depth) (inches)
Comments : Includes DMA cable, Power cord, ICD software
Comments : Plug 'n Play - Autoboot w/ICD
Asking : $150 + shipping

If you want something from the Misc area, i'll pry throw it in -
depending on what it is.

[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-]
M I S C
[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-]

If you want something listed below - make me an offer!

Item : ATARI LAZER 'adapter' box. I can't remember what these are
called.
Comments: But they are the boxes that plug into the computer
and the lazer printer plugs into this box. Comes with the
Lazer printer cord. And 1 DMA cable (as it's built into the
box) This box also has a DMA pass-threw.

Item : 6 (?) MFM hard drive mechs.
Comments: I don't know what works, and what doesn't. They all did work
when I put them in the box, but I cannot test them at this
point.

Item : Blitz Cables
Comments: Allows you to backup your software fast and easy!

Item : ST Sound Digitizer
Comments: Made by Hippo, includes software and cartridge

Item : Video 1000-ST
Comments: Includes Cart and german (paper) docs. Screen rez enhancer (?)

Item : Video Key
Comments: Lets you hookup your atari to a TV

Item : Mouse Master
Comments: Lets you click over between a mouse and a joystick on 1 port
(usually 0)

Item : 1040 power supply
Comments: Needs plug put back on (which I still have)

Items : SwitchBack
Comments: Difficult to explain what this is. This lets you save anything
to RAM or a file. (Not the best explanation, but best I
can do)

If you have any questions, or your interested in one of the items
listed above, Email me! All funds must be in US Dollars. I will ship
ANYWHERE.

Hello, I just got a 520 ST ala goodwill. As one could expect, I only got the computer and nothing else. What are the power pinouts? Can I get by with just +5v? What are the floppy pinouts? Is there a faq out there that I simply didnt find that tells me all this kinda stuff? Please reply by email. Thanks!

>
> Anybody out there using these two devices ? Could you please
> mail me the wiring scheme for the monitor cable ?

I have a TT with a monochrome monitor (a Sigma Designs
"Laserview" LDM-0019). It is physically identical to a
third-party monitor that was sold for the TT, but I cannot
remember the brand name it was sold under in the Atari world.

I had to build a cable, using a DB-9 serial cable and a DB-15
connector for the TT video output. The wiring is as follows:

pinout for db9 -> db15 cable for ECL monochrome monitor
to Atari TT

DB9 DB15

1 -> 4
2 -> none
3 -> none
4 -> none
5 -> 13
6 -> 15
7 -> none
8 -> 10
9 -> 14

2 & 3 9 & 10
shorted shorted

Of course I make no garantee that this will work for you. But I
would be surprised if the cable pinout was different from one
TT-compatible monitor to the next. (Someone please correct me
if I am wrong).

Hope this helps.

Yves

The ST will require +12V and +5V. I'm not sure about the pinouts. A PC power
supply that provides both voltages should do.

Other pinouts can probably be found here:
http://www.teleport.com/~atari/STinternals.htm

I havn't used Pacificst, but STonX will let you use either a disk image
or a directory tree (IIRC this may only be on the unix version though). I
hve a working AUTO folder on my Unix box running STonX.

> And while trying to copy a couple of .prg files into WIN 95, I receive an error that the .prg's

> Any insights?

W95 uses a VFAT filesystem, this may be trashing your floppy disks. Try
reformatting on you atari for PC-compatible and then copying the programs
onto it before the disk even _sees_ the PC.

1761. ST joystick port problems

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-03 00:00:00 UTC
From: "Peter R. Young" <pry10@damtp.cam.ac.uk>
Message-ID: <33943E0D.41C6@damtp.cam.ac.uk>
Source record: 16751

Hi,

I bought a 2nd hand 1040ST a while back and it works fine except for the joystick port 1 (the one where you plug the mouse in). The joystick fire button/mouse left button often dosen't work and requires the joystick socket to be moved around until it starts working again. I presume there's a dodgy pin in the joystick port. Is it a simple matter to correct this? Do I just need to get my hands on another joystick port and replace the one I've got?

Thanks in advance,

Peter

Source record: 16754
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi there,
I've just aquired some old Mega-ST's with a couple of 30 and 60 MB
Megafile Harddisks and one SH205. Some of these disks won't spin
up anymore :-(
I wonder if it is possible to get any RLL or MFM Harddisk running on a ST.
I hooked up a known good Microscience HH-1060 RLL-Drive (1024 Cylinders,
5 Heads) on the ACSI <-> RLL-Controller which was in the Megafile60 case.
then I launched the AHDI driver (Rev. 6.0xx).After the Disk made some
strange noise, the driver exited with 'Media description unavailable'.
After that I ran HDX but this program didn't found a valid harddisk.

I got the same error with spare Seagate ST277R, ST250R and Micropolis 1385
HD's lying around here.

Has someone ever successfully formatted a 'non Atari' RLL or MFM Harddrive
on a ST?
If yes, how (What drivers, formatting software etc.)?
It would be nice if I could run my old 280 MB RLL-Disk on this machine ;-)

Thanks in advance,
Martin.

I have no idea what "pseeudo" means?

But to auto boot prgs?... well heres how I do... I make a disk image
of an auto folder that comntains NVDI and a replacement file selector,
The same disk image contains ACCs such as nvdi, st guide and a few
others,
Set pacifist to autoload,

Then on clicking the MONO Icon on me win95 desktop, a couple of
seconds later I have a NVDI enhanced full screen fully working mono
tos 206 desktop,

From there i can change the drive A and B disk images and use the
emulated ATARI as should be:), I know that most auto folder prgs work
from here, so why not replacement desktops,

> And while trying to copy a couple of .prg files into WIN 95, I receive an error that the .prg's

AFAIK, Real Audio doesn't come with free sources to make a port to the
Falcon very realistic.

MPEG1-Audio Layer III however _does_ have free sources, but is a much more
complicated procedure than the Layer II player that exists for the Falcon.

We are researching the possibility of doing a Layer III player, but due
to limited time and knowledge, it's not done overnight (if possible at all).

I just tried out SAM (System Audio Manager) version 1.3 (the version patched by "Kosmic Phish") and discovered that it uses 1.6MB RAM! I have the buffer size set to 0 (zero) and no sounds installed, so obviously this figure will only get higher if I actually install some sounds.

Is this normal? Is it a known problem? What can be done about it?

This problem was observed on a TT030 with a total of 4Mb ST RAM and 4MB TT RAM.

>my web page.

Oh, well, that's no problem, then. NED runs as an accessory and can play
almost any of the standard audio format files - and CAB can pass them to NED
using the VA_START protocol. RA is a different kettle of fish - it's highly
compressed and frankly pretty poor quality (I am writing this on a Pentium 133
MHz box equipped with a 33.6k modem - and RA still sounds like crap).

Most likely it's a bad solder join on the circuit board. Just disassemble the
keyboard (and don't lose any of the myriad small screws or little rubber
cups!) and reflow all 18 of the joystick port solder joints with a tiny dab of
rosin flux on each one.

The spend the next 2 hours trying to get the rubber cups back in the right
places and put the kb back together. <G>

I'd love to be able to use all my old Atari programs on my Pc but I only back on the scene very recently. I've heard PacifiST bandied around but I'm really lost. Is there an FAQ somewhere I can read. Also where can I get TOS images from?

PaCifiST can be found at many places (actually a quick search on Yahoo or
AltaVista would have probably told you). Try out:

The Atari ST Emulation FAQ

http://members.iglou.com/rsg0910/atstemu.faq.html

PaCifiST ST emulator

http://wwwperso.hol.fr/~gidouin/pacifist.html
http://www.geocities.com/SiliconValley/Lakes/6875/pacifist.html
http://www.jetman.demon.co.uk/st/index.html
http://shaw.iol.ie/~ajankows/st/pacifist.html

If you surf around those places you'll probably find those pirated TOS ROM
images.

p> and 1.44 M which would be best ?

Yes. PC drives are OK.

Use the 720K - set the device ID to 1. If it doesn't work rotate the
connector through 180 degrees.

Whoops, steady on, Rich. On the 1040ST the joy port is soldered onto the PCB so there is no need to get involved with the k'brd (except to remove it from the field of play!).

p> joystick port and replace the one I've got?

A common problem :)

The only mechanical support for the port socket is the soldering to the PCB.
After a bit of joystick pluging/unplugging some of the soldered joints will
snap.

Just remove case, keyboard and shielding to expose the port and resolder. The
worst you will find is that some tracks may have lifted.

Thanks for your help guys, I read in an MPEG FAQ that a german company or research institute have the code for Motorola DSP chips but as they are only partially funded by government it would require a substantial investment to purchase their know how.I got the feeling that the Falcon wouldn't be quick enough. I'll mail the FAQ to anyone who is interested. Apparently Real Audio was originally worse than AM quality but version 2 is very much better. I haven't heard it myself so I can't speak from experience.

Regards,

Bill Wormald

DSP-speed isn't that much of an issue for doing mp3 decoding on the falcon.
What's the main problem is memory limitations. The DSP only has 32kWord's
(96kB) RAM, and mp3 requires some more tables and buffers compares to mp2.

Not sure how much those tables could be optimized really, or if you can
get the 030 to do table lookups and some calculations in advance.

My brother's going to have more time soon (I hope :)), so I guess we'll
continue the quest for hope and glory then.

Well.. he will anyway.. and I'll sit around grabbing my credits :)

>figure will only get higher if I actually install some sounds.

Nope, it wont - it appears that there is a bug somewhere in the memory
allocation routines which means that if you set it to 0 bytes it will take
1.6Mb.

If you set the buffer size to 1k it only takes about 200-300k.

I haven't checked that this bug also exists in SAM 1.2, but I guess so
(we didn't change the memory routines at all).

>Is this normal? Is it a known problem?

It is known / confirmed now. (Thanks to the guy on IRC - you email address
bounced?)

>What can be done about it?

Change the buffer size from 0 to something bigger. :-)

>This problem was observed on a TT030 with a total of 4Mb ST RAM and 4MB TT

The speed is also a problem at this point. There are more DCT's (Discrete Cosinus Transforms) in mp3 than mp2, so with the current status of the mp2 decoder, which takes most of the DSP time, it would probably not be possible.

Yes, I know, but Noring has already stated that the DCT's could be speeded
up, which would solve the speed problem (if it's ever done :)).

1790. Best Bulk Mailer: Mailloop

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-05 00:00:00 UTC
From: aslfkj@alsdjf.com
Message-ID: <5n74de$v@newsfep3.sprintmail.com>
Source record: 16775

Mailloop v3.0 is an industrial strength bulk mailer.

Mailloop v3.0 is a bulk mailing program for the internet. It can take a single message and broadcast it to either a listing of e-mail addresses or to a listing of newsgroups. Creates custom newsgroup lists by filtering NNTP servers. Creates custom e-mail lists by extracting them from newsgroups. Can also extract e-mail addresses or newsgroup names from other protocols. Built-in NNTP, SMTP, POP, FTP, HTTP, EXEC, CGI, WHOIS and FINGER clients. Anti-cancelbot feature. Automatically processes remove requests. Includes extensive on-line help.
The most powerful bulk mailer available. Requires Windows 95 or NT 3.51+ and internet access.

The "Program" Mailloop is only available in English.

For more info goto: http://205.199.4.219

http://205.199.4.219

Using it is easy:

1) Create a message (http://205.199.4.219/editor.htm)
...by using the pull down menus or
...by using any editor

2) Create a newsgroups list (http://205.199.4.219/news3.htm)
...by filtering an NNTP server or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from any FTP file or
...by extracting from any HTTP file

3) Create an e-mail list (http://205.199.4.219/em3.htm)
...by extracting from newsgroups or
...by importing from any text file or
...by manually creating with any editor or
...by extracting from a WHOIS response or
...by extracting from a fingering response or
...by extracting from a UNIX response or
...by extracting from any FTP file or
...by extracting from any HTTP file or

4) Broadcast the message
...to the e-mail list or (http://205.199.4.219/embc.htm)
...to the newsgroup list (http://205.199.4.219/ngbc.htm)

5) Then process the remove requests
...by using the mailbox processor (http://205.199.4.219/pop.htm)

6) If you want you can use the Newsletter Sever
...The Newsletter Sever will allow you to have an topic-specific newsletter that other can subscribe
and unsubscribe to.
...Customizing this server response files (http://205.199.4.219/response.htm)
...Creating a new newsletter (http://205.199.4.219/create.htm)
...Creating and Updating a newsletter the actual newsletter (http://205.199.4.219/update.htm)

Absolutely! You would do well to partition the drive to perhaps 4 logical drives (to avoid huge slowdowns as the drive gets more and more files on it) but there should be no problems as lognas you stay away from the Quantum Fireball and similar drives that go a bit off the "plain-Jane" SCSI standard.

Depends on the model. The STf and STfm use the later keyboard/interface
combo, while the 1040 with no internal floppy has the ports on the
motherboard. I have mixed feelings about that change - it's easier to swap
out the ports completely, but more work to fix the existing ones.

1797. folder problems in pacifist

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-06 00:00:00 UTC
From: ebermann erwin <erwin.ebermann@univie.ac.at>
Message-ID: <3397C3B3.DF68BCB1@univie.ac.at>
Source record: 16782
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech
Body handling: HTML body converted to readable text

I use pacifist 0.44 and programs like That's Write. I face constantly the problem that I cannot select documents from folders within a given program. I will get the following message instead: "this folder does not exist....". I am still able to read the list of documents included in that folder but will not be able to load any document.

To load a document I have to leave That's Write and I have to draw the document on the image of That's Write on the desktop.

I face similiar problems with fonts I cannot load within That's Write. Some fonts do not appear inside their font folders when looked for within That's Write program.

Does somebody have a solution for that problem?

Thanks

Erwin

My newsreader seems to be eating lines up. What I meant was:

SCSI is the most popular drive standard among Atari users. It is faster and
more modern than IDE. You can install several drives in a SCSI chain
(including ZIPs and CD-ROMs). All you need is a DMA/SCSI adapter (there are
plenty of these), and mount the drive in an external case.

There seems to be a small bug with Hard Drive emulation and folders. Try
making a BIG floppy disk image (like 4Mb), and run your critical software from
there. Most HD problems can be resolved that way, even if it is not the most
'elegant' solution. I beleive the author is working on the problem.

Nick

PS. HTML is not welcome on newsgroups. 90% of newsgroup users (and probably
100% in the atari world) do not have HTML newsreaders.

MFM is impossible, unless you want to install it one the old Atari Megafiles
that used MFM drives, but they are pretty outdated.

IDE is possible with a new adapter board available from TUS or Titan in the
UK. There is apparently another one in Germany. The problem is how will you
fit a 3.5" drive inside an ST case. You will probably either have to"
towerize" the ST, or get a 2.5" drive to fit inside the standard case.

s
(there are plenty of these), and mount the drive in an external case.

Hi all there,

We want to setup here in Poland new host with atari stuff running on atari. There is already ftp site (piwo.bl.pg.gda.pl/pub/atari) and we have a mailing list (in polish unfortunetely) and we (members of the mailin list) have assigned some funds for new HD. Now we are going to run the site on atari computer and we are looking for some used, inexpensive TT with ethernet card so we will install linux on it and have atari/motorola powered site on the net.

regards,

Szymon.

SLM804 Atari Laser Printer! Atari Did Not make these Printers, they just put their Name on it while it was sub contracted to some one else. In this case Canon. So if your worried about buying Toner, Drums & more from Atari just go to the Manufacturer or as I did, Best Electronics. Not Atari. This SLM804 recently had a New Drum Put in along with Initializing Toner which is required for a New Drum. It Comes with All Manuals & Disks, Two additional changes of Toner, each good for at least 3000 Sheets, the Old previously changed drum which can be rebuilt like new by businesses that do that sort of thing. Plus UltraScript ST, PostScript for your Atari SLM804 Laser Printer as well as the PS 35 Font Set. Packages 1-7. It Prints 8 Pages Per Minute at 300 DPI (Dots Per Inch). I know this printer very well because I babied it myself. The only reason I'm selling my own Personal Printer is I no longer have need of it. I Produced the Most Professional Output with this Printer. I loved the fact that if any Software for my Atari could support any Laser Printer, it would be this one.....$400 U.S.

Offer only available in the United States.

1808. Win95 OSR 2.1 CD $35 W/Fat32, Fat converter, Full install

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-07 00:00:00 UTC
From: jasonben@aol.com
Message-ID: <5nc8ue$d7n$909@usenet85.supernews.com>
Source record: 16793

Win '95 OSR-2.1 on CD with Fat32 Boot Floppy, FAT to FAT32
converter; $35 + 4.50 for Postage/COD, or offer.

Full install version. USB Support. This CD also contains
the Microsoft FAT to Fat32 converter.

Are you tired of losing up to 40% of your disk capacity
to the huge cluster size of FAT16, P-n-Pray that does
not work, poor pcmcia support, misidentified motherboard
resources, CPUs, ect?

Well, moving to the OSR 2.1 version of Windows '95 is the
answer.

Win '95 OSR2 also contains important patches, an expanded
(and debuged) drver library, PnP that works, GUI improvements
and bug fixes.

Yes - Some, not all, of these are available for as downloads.
Yet - The most important parts: *FAT 32*, the Kernel and GUI
enhancements, PnP improvements and proper CPU identifier codes
are NOT available for download and currently can only be
obtained with the purchase of a new computer or "memphis"
(Win'97), whenever that will be available.

The CD is the full install version. Included is a OEM cd-key,
an OSR2 boot floppy for creating a new FAT32 partition, MS CVT.EXE
for converting a FAT partition to FAT 32 detailed installation
instructions. In addition to these instructions, there is full
documentation on the CD. There is no "paper manual." Except
detailed installation information. Your current Win '95 manuals
will still apply, with a few *highly documented* exceptions.

The primary reason for migrating to OSR2 is, of course, FAT32,
which increases the storage capacity of your drive simply
by keeping the cluster size at 4K, despite the size of your
hard drive. It also recognizes partitions larger than 2.1g,
the current Win '95 limit.

I was hoping to get $ 35 for the CD, Boot Disk and instructions,
+ 4.95 for USPS COD. I am, however, open to reasonable offers.
I will pay shipping on pre-paid orders.
E-mail for more information.
Jason

1809. STinG on 1040 STE

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-07 00:00:00 UTC
From: perot@suse.modem.stud.uni-hannover.de
Message-ID: <EBEpCn.Kru@suse.modem.stud.uni-hannover.de>
Source record: 16794

Some people had some trouble getting STinG to work on Atari 1040 STE's. Someone told me that when the AUTO folder sequence is DRVIN, STING, MFP, MIDI, the machine won't bomb anymore, but work fine. J. Kock found out then when setting MFP.PRG to NOT install an RSVE cookie, the machine works well again. Both tips worked, and gave me the hint where to look.

I had the opportunity to play with an 1040 STE today. I found the bug and fixed it. Please get the new version from my home page (CORETOOL.LZH). Note the main distribution (STING.LZH) doesn't contain this fixed kernel yet. With this bug-fix version, the abovementioned kludges are not neccessary anymore. In fact I strongly suggest to rearrange the AUTO folder to have the programs in the proper sequence, i.e. first all HSMODEM components, then STING.PRG.

Cheers Peter

From: Craig <Craig3p0@ix.netcom.com>
Message-ID: <339A512D.6854@ix.netcom.com>
Source record: 16795

Hi,

I have a STacy 2 which I use for music production...
Recently something went funny with the hard disc. I was cleaning up
files and I deleted the desktop file by accident. It really screwed
everything up. I lost the majority of my music files.
SO I tried to just reformat and start over...
My hard disc utilities won't work! When I go to format it says it can't
do it and to check the connections--- but, it is internal.
It is a quantun lp240s gm24s01x.
Do I need a newer version of HDX?
If so can anyone get me a copy? I'm in L.A., Calif.
P L E A S E help. I love my STacy dearly and I use it every day.
(I'm still using it now, but it keeps glitching up CUBASE-
-the computer has said "data on disc may be damaged cancel/retry "
when I copy files (I tried reinstalling Cubase).
H E L P!!!!

please EMAIL any info.

much thanks.

```
j > Anyone have plans or hardware for installing MFM or IDE hard drives on
j > an
j > ST? I would like very much to do the conversion on mine. Thanks.
j >
```

MFM drives are a pretty simple hook-up. You'll need an Adptec 4000
SCSI to MFM board, and some kind of SCSI adapter (like an ICD ADSCSI).
This of course brings up the point, why use MFM if you've already got
a SCSI host adapter? MFM isn't really practical in a world where a 40meg
SCSI drive can be found for peanuts.

If you really want to use an MFM drive okay, you can find SH204's, Megafiles
, etc., all made by Atari, they use a similar sceme to what I mentioned
above.

As far as IDE, there are some new adaptors out now (finally!), but I tend
to feel that IDE's are more trouble than there worth. SCSI is a much more
robust technology, and It gives me few hassles during set up. IDE is a
nightmare by comparison (of course my 2 IDE drives are in a PC which is a
nightmare all in itself! :-)).

Later...

Does anyone know if there are any ATARI service centers (STacy2)
in the Los Angeles area? T.C.N. in Burbank is no longer in business.
Please email me thanks!

1814. ST: CD ROM on IDE card?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-08 00:00:00 UTC
From: Branko Badrljica <brankob@stel.si>
Message-ID: <339B4CB4.7802@stel.si>
Source record: 16700

Does someone know anything about connecting IDE CDROM drive via
TOS2.06&IDE card to ATARI ST?
Would AHDI 6.x recognize CD unit at boot-up or I need special driver for
this ?
If above is possible, would I be able with such combination to read
CD's, written by PC&CD-R unit?

Answer is welcome in this NG or via Email, but in later case use
address above.

Thanks in advance.

Branko Badrljica

1815. ST Monitor Connection

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-08 00:00:00 UTC
From: matthew.winter@virgin.net
Message-ID: <339a27f6.889779@news.virgin.net>
Source record: 16701

I have just recently got my ST out of the box again, and wish to connect it to the same monitor I have hooked up to my PC. A standard SVGA monitor. Is it possible to connect such a monitor to an Atari STE, if so how would I go about making the connection.

Thanks
Matthew

6-7-97 >>>>>> [][] ATARI Clearence SALE [][] <<<<<< 6-7-97

()()()()()

Item : Complete System
Computer : Mega 4 w/ 4mb RAM and TOS 1.04
Monitors : Monochrome (SM124) * AND * Color (SC1224) w/ Monitor master
Software : Over 100 original games (100's of disks!) plus
productivity software. Also MANY magazine disks
Comments : Also includes joysticks, Mouse, and a Modem
Comments : The Mega4 has the original box and manual!

Asking : $275 + shipping

I'll throw in whatever else you want (within reason) from the misc area
that your interested in.

()()()()()

Item : Complete External Hard drive setup
Host Type: ICD Link
Megabytes: 139mb formated
Type Case: Plus Impulse flat case
~ size : 13"(width) 2.5"(height) 14.5"(depth)
Comments : Includes DMA cable, Power cord, ICD software
Comments : Plug 'n Play - Autoboot w/ICD
Asking : $150 + shipping

I'll be happy to load the hard drive with shareware/pd software.

[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-][-]
M I S C
[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-][-]

If you want something listed below - MAKE ME AN OFFER!

Item : ATARI LAZER 'adapter' box. I can't remember what these are
called.
Comments: But they are the boxes that plug into the computer
and the lazer printer plugs into this box. Comes with the
Lazer printer cord. And 1 DMA cable (as it's built into the
box) This box also has a DMA pass-threw.

Item : 6 (?) MFM hard drive mechs.
Comments: I don't know what works, and what doesn't. They all did work
when I put them in the box, but I cannot test them at this
point.

Item : Blitz Cables
Comments: Allows you to backup your software fast and easy!

Item : ST Sound Digitizer
Comments: Made by Hippo, includes software and cartridge

Item : Video 1000-ST
Comments: Includes Cart and german (paper) docs. Screen rez enhancer (?)

Item : Video Key
Comments: Lets you hookup your atari to a TV

Item : Mouse Master
Comments: Lets you click over between a mouse and a joystick on 1 port
(usually 0)

Item : 1040 power supply
Comments: Needs plug put back on (which I still have)

Items : SwitchBack
Comments: Difficult to explain what this is. This lets you save anything
to RAM or a file. (Not the best explanation, but best I
can do)

If you have any questions, or your interested in one of the items
listed above, PLEASE Email me! All funds must be in US Dollars.
If you respond here, PLEASE keep the same title so that I can easily
find it.... I will ship ANYWHERE.

Can't help you find the IDE card, but if you manage to locate one...

>Would AHDI 6.x recognize CD unit at boot-up or I need special driver for
>this ?

AHDI can barely find itself. You need a CD-ROM driver (just like
Messy-DOS and Windozzze do). I presume ExtenDOS Pro can handle IDE, but I
don't know for certain.

>If above is possible, would I be able with such combination to read
>CD's, written by PC&CD-R unit?

If they are in the universal ISO9660 format, no problem. You still can't run
PC programs, though. Which is just as well, considering that many of the
zipped files for the latest PC programs are over 4 megs in size.

>Answer is welcome in this NG or via Email, but in later case use

Well, sort of. IF all you need is high-rez mono, yes, you can do it. The sync rate on a VGA/SVGA monitor, however, is 31.5 kHz; ST-low and ST-medium sync at 15.75 kHz (the HTSC standard - it may be slightly different, but it will be simialr, for PAL and SECAM machines).

Instructions for making the cable (and a list of older multi-sync monitors that DO work) may be found at ftp://ftp.teleport.com/users/atari/multsync.faq

I've made one for myself a year or two ago and copied it a few times for
friends.
It works OK. But now I'm fed up with tons of flopies with bad CRC errors
and would like to archive my ATARI stuff on CD. Given that I have also
access to CD-R on work, CD instead of flopi seems a nice idea...

1823. Re: 1040ST: Power Supply - Result

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-09 00:00:00 UTC
From: mbergman@orednet.org
Message-ID: <5nhqji$8gq@ednet2.orednet.org>
Source record: 16708

First, I would like to thank those folks who responded to my query with very helpful leads to other information which ultimately resulted in the repair of the 1040ST power supply. Also, it would be a huge disservice to omit the hundreds of other Atari users whom in the past have submitted posts in the Atari news groups. I later discovered that Daja News has an "old" selection which contains many more archived posts. This was the nooks and crannys I failed to fine early on. WONDERFUL tibits of info are contained in these archives. Makes me wonder how many newbies know about these archives.

Upon further research in the Daja News archives AND helpful info from a couple of respondants to my post, I was disappointed to discover that I would NOT be able to run Minix or Linux on this model of Atari (1040STF). Minimum necessary Motorola processor is the M68030, where as my model houses a M68000. A serious bummer! However, I'm confident my grandchildren will make good use of it when they visit.

The Atari power supply repair was a good home project to learn more about small switching power supplies. I would certainly NOT recommend that just anyone dive into such a project unless they FIRST UNDERSTAND the potential life treatening hazards involved. With ANY power supply using 120 or 230 volts AC input, there are dangerous high voltages present that CAN and HAS killed!!! If there's ANY doubt knowing what your doing, just simply DON'T!!

My alternate route of repair was knowing that Best Electronics stocks replacement power supplies for the 1040STF. They were kind enough to return my call and confirm. I needed this alternate route just in case my smoke tests actually produced smoke.. har!

The Atari is happily playing along. It's currently undergoing burn-in tests to confirm that all is well with my repair. Many, many thanks goes out to those who responded directly and to all Atari users who have posted various articles and information data to the Atari newsgroups.

MW>I have just recently got my ST out of the box again, and wish to
MW>connect it to the same monitor I have hooked up to my PC. A standard
MW>SVGA monitor. Is it possible to connect such a monitor to an Atari STE,
This is possible with a graphic card. But then you can't use the old
SM124 any more. Instead, you may have a great resolution like 800*600 in
hundreds or thousands of colours (like on a damn Win PC :-)

Or, my tip, buy a Falcon 030 ;-)

Christian

1830. Falcon Buffer Mod question

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-10 00:00:00 UTC
From: Brian Hutchinson <hutch@ena-east.ericsson.se>
Message-ID: <339DBA27.41C67EA6@ena-east.ericsson.se>
Source record: 16715

I have two questions:

1. I found the buffer mod for the Falcon 030 at
http://rand.thn.htu.se/~johan/ab040/buffermod.htm

I am not a hardware person so I would like to know if
using a 74HCT04 from Radio Shack would be OK.

2. Are there any other hardware mods I should do to my Falcon?

Thanks,

Brian

If you want to use the ST as a terminal, then you should not need MiNT at
all. All you will need is a terminal emulation program such as CoNnect.

To anwser your question, however, all the MiNT versions still work on the
68k, although the MiNT 1.14 VM will not work on the 68k. (OTOH, I can't
get the VM to work stable on any machine.)

FreeMiNT 1.12.6 and FreeMiNT 1.14 are exactly the same except for the VM,
so it won't matter which you use.

This is wrong. MiNT uses the MMU *if it is available*, but does not
require it. All versions of MiNT (should) work on the 68000 (unless it
was explicitly compiled to exclude the support).

Rename the mint.prg file to mintnp.prg
then mint will start without memory protection.
I use this on my STE and it works.

Things that need virtual memory normally (always?) need a decent MMU on the CPU. This is the case with 68030 and higher. It may be possible to do handle virtual memory entirely in software, but I'd imagine that it is very slow.

Thanks everybody for your help!

Adrian

1836. Atari 520ST, 1 floppy drive

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-11 00:00:00 UTC
From: Frank A Reynolds <fr0c+@andrew.cmu.edu>
Message-ID: <Ynbh5_e00iWn05aEg0@andrew.cmu.edu>
Source record: 16721

Thanks for the replies to my pervious posting, with them I was able to get my friend's Atari 520ST up and running, it appears the power cord was not engaged.

As there is only one floppy drive, it was not clear to me:

1. When you are swapping disks what the correct procedure, do you just push the button on the drive?

2. What is the procedure to copy the entire contents of one disk to another one?

3. If you are running a program on one disk, how do you save a document to another disk?

I tried these things and either they did not work using the procedure I followed or I thought there was a safer/better way.

Frank A. Reynolds

1837. For Sale!! Atari 1040 STE

Good News For RGB Monitor Users!!!!

A new product, the VideoTurtle from Turtle Enterprises, is now available!
This product converts RGB known as TV RGB, into S-Video signals. Replacing
the need for an older TV RGB Monitor.

ANY SYSTEM, that outputs TV RGB, can use the VideoTurtle. Some of the
many are:
Sega Genesis/32X/CD-ROM
SNES
Amiga
Atari ST
Neo Geo
Apple IIgs
Laser 128
MSX II/MSX II+
Adam
Commodore 128
TV RGB Monitors(for uses other than computer/video games)
Video Arcade Games, ones that output RGB.
IBM CGA

Also, all of your video modes are supported too!

Please, no flaming! If interested in the VideoTurtle from Turtle
Enterprises, please email me-ab453@cleveland.freenet.edu

Thank you!

1840. Advice on ST+PC 'network' for Cubase please

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-11 00:00:00 UTC
From: la@techprt.co.uk
Message-ID: <339e5e2c.1084278@nnrp.cambridge.britain.eu.net>
Source record: 16725

I have just pulled my ST (and other music recording equipment) out of the attic where it has lived for the last 4 years. I hope someone might advise me on the best, cheap way of integrating it with my ageing 386 PC.

Requirements are:

1. ST to run Cubase without it loading from floppy. My FDD was always temperamental so I'd like to avoid FDD on the ST altogether. I have a 130MB SCSI HDD available which is pathetically small for my PC but would be HUGE for my ST requirements and a chance to buy an ST DMA-to-SCSI interface.

2. File transfer between ST and PC. A slow serial link would be sufficient, but ideally they would be truly networked. Transfer speed is a lot less important to me than cost.

3. If possible I'd like to be able to add another PC at a later date. PC-to-PC speed matters a bit more. I guess the strategy should be to make the ST look like a PC to the network.

If this is a FAQ I apologise - could someone point me to it?

Thanks in advance for your help.

Lol (who is obviously naive about networks)

From: quantum@sunlink.net
Message-ID: <5nmer4$r61@mars.sunlink.net>
Source record: 16726

Hi! I have an Atari STe rotting away in my sister's room after I upgraded to my new Falcon. I'd love to get a VGA monitor for it, but dammit I just don't have the money :(However, if some brave soul would like that STe system, we will be very happy campers. Here's what the setup includes:

Atari 1040 Ste w/ 1 (maybe 2) Megs of Ram
Atari SC1224 Color Monitor
If desired, I have a 2400 baud modem I'll be happy to throw in free.
Good amount of software that my Falcon can't run, including:
Hard Drivin'
Ballistix
Populous II
Stereo Master (digitizer)
Laser C (w/ manual)
HiSpeed Pascal (w/ manual & my old Pascal book from Intro Programming my first year at college (only 2 years old))
Warp 9 Registered Version (excellent speed up program!)
Plus other little shareware gems I've picked up if desired..

I'm asking $350 (obo) for the entire package plus shipping and handling from the Poconos, Pennsylvania, to wherever the heck you live. The computer and all software includes original docs, software comes with original covers. Computer is in perfect condition except for the right shift key is broken. Other than that, it has been an excellent and dependable machine over the years.

Please email all responses to the same address as this letter is from, quantum@sunlink.net. I wish I had time to read this great newsgroup for responses, but alas, I cannot... :(

Thanks in advance, look forward to talking to you,
George Garner

: > whether or not it supports 68000 chips!

I'm not a mint head just yet...I've only played with it once or twice,
but "I THINK" you can run any of the MINT kernels on the ST or STe as
long as you name it MINTNP.PRG in your auto folder. NP in the name tells
it to disable memory protection, which the M68000 obviously can't do since
it doesn't have the MMU properties built in. Actually, I'm not even sure
that Protected Mode works at all...on any machine...as everything I've
tried on my Falcon requests that MINT be booted NP in the docs.

If you intend on setting your ST up as a dumb X terminal, you might
want to get the TAF package and use it as a starting point. I downloaded
this package before CAB was working online, as that was its purpose...
to browse the web with Chimera under X windows. It worked on my 4meg
1040STe with no problems, running Chimera, and often a shell and some
clients (such as ftp), as long as memory held out. Sometimes, I found
that I needed to kill off all the processes and start over because of
memory cramping...but at least it didn't bring the system down.

I've heard that people have succeded in setting the TAF package to run
as a total DUMB X windows terminal on the ST. I.E. log in and run
NetScape on a provider's shell account...the ST just displays the data,
and the isp machine does all the work. Is that kinda what you have in
mind?

OH well...I'm new to MINT as well...I hope this helps a little. The
TAF package mentioned earlier can be found at the hensa ftp site.

Brian

Well, it wasn't as pervious as that, you know ;-)

>
>As there is only one floppy drive, it was not clear to me:
>
>1. When you are swapping disks what the correct procedure, do you just
>push the button on the drive?
>

Yes, nothing more. If you have window open and want to force the window to
refresh to show the contents of the new floppy (media change), you can either
close the window and reopen it, or press the 'Esc' key.

>2. What is the procedure to copy the entire contents of one disk to
>another one?
>

Even with 1 drive connected, you have 2 drive icons on the desktop. The system
will just ask you to swap floppy A and B in the drive. Just be careful you
don't get mixed up (I think some older TOS versions do not check whether you
have inserted floppy A or B). The best way is to write protect the 'source'
floppy.

To copy an entire disk, drag the floppy A icon over the floppy B icon.

To copy a file to another disk, copy the file icon over the floppy B icon.

The computer will then ask you to swap disk A and disk B quite a few times,
depending on the size of what you want it copy. This can be really annoying if
you're copying a large file or an entire disk.

There are diskcopy programs around that load the entire disk A contents in
memory and re-write it directly on disk B, or ram-disks that make a virtual
drive in RAM that you can use as an intermediate disk (but with only 512K, a
520ST might be a bit short on RAM for this).

>3. If you are running a program on one disk, how do you save a document
>to another disk?
>

Eject the program disk, and insert the data disk. When you have the file
selector to save/load your files, click on the 'close' square (upper left

corner of the file list) to force a media change if it hasn't already done it.

Most ST programs don't require to have the program disk in the drive for it to run. They usually load everything they need into memory when the program is launched so you can use another disk for you data.

>I tried these things and either they did not work using the procedure I
>followed or I thought there was a safer/better way.
>

It should work like this.
A better way would be to have a 2nd drive or a HD :-)

This is possible. You need, as you say, a DMA/SCSI adapter and some driver software.

>2. File transfer between ST and PC. A slow serial link would be
>sufficient, but ideally they would be truly networked. Transfer speed
>is a lot less important to me than cost.

This is also possible. Try Ghostlink (you can find it on the net). This will 'enslave' the PC's drives, even CD-ROM and floppy to the ST's desktop. But the drawbacks are: serial connection is a bit slow and you cannot laucnh programs from the enslaved drives.

>
>3. If possible I'd like to be able to add another PC at a later date.

It appears that my news server repeats some messages with delay of few
days. I think I posted answer to that question, and catched one response
in a resulting thread, but now I can't tell whether you didn't
understood/accepted answer or my server is playing with me again.
If latter is the case, I apologise.

You can't boot up your ST without any (EP)ROMs in it in no way. Even
those old ST's that had to be booted up with some kind of sistem disk
had miniature ROMs (2 x 16 Kb ROM if memory serves me right) with boot
code in them. After powerup CPU reads its supervisor stack vector and
reset vector from ROM and jumps on location pointed by reset vector
(If you just press RESET then things are a bit different, but this is
not relevant now).

If you have no ROM's whatsoever in your machine then CPU will read some
garbage instead of what it should and then it will jump god knows
where...

So, you have several options:

1. Get from some service shop another set of TOS chips from some burned
or TOS upgraded machine.

2. Find someone with EPROM programator and a friend with working ST and
copy the chips. This is probably illegal, but with ATARI's vital energy
and quantity of copying involved I think that you have nothing to worry
about, except maybe about burning friends ST too ;)

This issue involves also some mild technicalities about right kind of
EPROMS for your machine. Some ST's have TOS in 6 32Kb ROMs, while others
have two chips with 96 Kb(or 128Kb ?) each. Also some boards have open
both possibilities ie. 2 or 6 chips. Also, for the two chip version, you
will need 2 x 27C010 EPROMS or something similar, which happen to have 4

pins more and are also not 100% pin compatible with old ROMs.

3. Buy a 260,520,1040 ST or similar machine with decent TOS almost literally for peanuts. Combine one machine from both and have other one for spare parts.

4. Cut your image file on 2 or 6 parts, depending on version of machine. Blow 2 or 6 EPROMS with pieces of file and stick them in your machine. This can be frustrating if you don't know EXACTLY what are you doing. For one thing, you can't just cut your file in six pieces, before that you have to do some "card shuffling" with individual bytes of image file.
I am assuming here that you have made image file in exact way CPU sees TOS in memory map, ie. without any rearrangement of data for burning into each chip.

If you want for example 6 chip version, you have to separate odd adressed bytes in your image file in one half and even ones in other half. Then you just split each half in three consecutive files, each exactly 32Kb in length. If you want the two chip version, then just do first step of shuffling, and burn each half in one chip.

5. Forget the whole thing. Its almost trivial, but you should have to have access to EPROM burner, right kinds of EPROMS, good binary files for each EPROM, and some knowledge about ST's inside. If you are lacking many of those, then its maybe the best option to save your nerves and just byu another one.

Hope this helps,

Branko

Yes, do it. You ought to be able to find an h/a second hand. Make sure you
could disable parity on the HD if neccessary or you will be a little limited
in your choice of h/a (e.g. Supra h/a will not handle parity).

l> 2. File transfer between ST and PC. A slow serial link would be
l> sufficient, but ideally they would be truly networked. Transfer

You can get simple slow serial with Ghostlink (PD). The PC is a dumb slave;
the ST represents the PC filestore as a desktop partition and you can do all
the normal file operations with it.

For a faster parallel connection look at the s/w from PARC.

1859. HD format Question

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-13 00:00:00 UTC
From: Craig <craig3p0@ix.netcom.com>
Message-ID: <33A21D23.5272@ix.netcom.com>
Source record: 16744

I have a quantum 240 SCSI drive in my Stacy laptop.
I got it LOW LEVEL formatted on an IBM.
What is the next step before I can format w/HDX?
please email me.
So I need a special program?
Also I'm looking for a current version of HDX.
Does anyone have one for sale?
Thanks

Lawrence Archard (la@techprt.co.uk) wrote:

Hiya, sorry I can't be much help, but your post reminded of something
I saw when browsing the net several weeks ago. I ran across a web
page boasting a SCSI based LAN modem for the Atari line of computers.
Also had some jibber about building a ROM port based LAN card.
If this card is a reality...it might be just what you need. It
doesn't sound cheap though...so you might just want to get a removable
hard disk of type and cart files back and fro that way. And there's
always the nearly free null modem cable Ghost Link type options...
check Atari FTP sites for such networking solutions.

Sorry, I can't remember where the url for that LAN card was, but
I was searching under the keyword Atari and it poped up somehow.

1861. FS: CLABS MKI Atari Falcon + Extras

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-14 00:00:00 UTC
From: David Butler <dhbutler@tiac.net>
Message-ID: <5nufnm$bnd@news-central.tiac.net>
Source record: 16648

For Sale As Bundle (In the United States only):

C-Labs Atari Falcon MKI with:
14mb ram (installed)
Alpha-Data mouse (original Atari Mouse not included in package)
BlowUp =B3Hard I=B2 (screen resolution enhancer)
SVGA Monitor adapter
RGB Monitor adapter
Apex Media (Animation/Morphing program for Falcon only)
Original Manuals and software included
Power UP (32mhz accelerator with no cache, gives you a %15 speed boost)

What it doesn=B9t have:
A Hard Drive
A very good floppy drive (recently discovered the drive is a little
flakey, and may need replaced)

This unit is in extremely good condition (it was hardly used due to
Fatherhood ;-), and is less than two years old.

Considering the flakey floppy, I am only asking $350 (firm), which I think
is one heck of a deal (Apex Media alone is about $150 new). Only other info
you should know in advance is that there is a little glob of clear superglu=
e
that I put on the two =B3home keys=B2 because Atari, in their wisdom, decided
not to do this. If you are a touch-typest this will be useful - it does not
mar the keys, but you can see it. First $350 gets the unit. I will pay
shipping and send it COD.

Please send responses to dhbutler@tiac.net.

Note, I sometimes do not check my mail for up to a week. Please do not take
this as a lack of interest on my part.

1862. FS: Migraph Hand Scanner (nice)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-14 00:00:00 UTC
From: David Butler <dhbutler@tiac.net>
Message-ID: <5nufos$bnd@news-central.tiac.net>
Source record: 16649

For Sale (in the United States only):

Migraph Handscanner with Touchup.

Original 400dpi b&w Migraph handscanner with Touchup and full documentation
(sorry, no original box).

Plugs into your ST/STe/TT (or Mega ST/STe) cartridge port (does not work
with Falcon systems)

This is an extremely good scanner, it produces absolutely beautiful results
- it is now about 7 years old, but works like brand new.

Asking $100 (firm). Will pay shipping and send it COD to first taker. You
realistically need at least 2megs of ram to make much use of this device.

Please send replies to dhbutler@tiac.net.

Note, I sometimes do not check my mail for up to a week. Please do not take
this as a lack of interest on my part.

Magic for Macintosh users, what are your experiences??

I am looking to run Calamus and Calamus SL, as well as Outline Art on my 160mhz 603e based Macintosh clone. What have your experiences been with the Magic for Macintosh product (the demo just seems to crash most of the time, so I have not been impressed).

Also, is there any way to print from the Calamus produces via. MagicMac since Calamus uses its own printing techniques?

Thanks,

-David Butler

1865. Distributors Wanted NOW!!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-14 00:00:00 UTC
From: Tony Scott <summer@laoffices.com>
Message-ID: <5nubtm$84p$7526@cadmium.aware.nl>
Source record: 16652

Hi,

This is a Solicitation Email, we are looking for new TUFF'97 DISTRIBUTORS.
TUFF'97 is a promotional concept for a prospect follow-up system called
"Simple Track". Software designed for Windows 95, 3.11 and NT
machines. (Macintosh users read the NOTE below(*))

Concept:

The TUFF'97 software includes a copy of Simple Track, so you can use this
for your own personal administration (free). However, the TUFF'97 software
is designed to give you BIG TIME credits for just taking the efforts to
PROMOTE it.

How do I get those credits?. Easy, just distribute/promote it. How?
(Give away the software for free, put it on your website/homepage
and let everyone download it. Give it to your friends, attach it by
email etc). With a one time $40.00 (USD) validation code purchase,
YOUR name becomes part of all sofware you sent out to your customers.
When your TUFF'97 software gets validated, all your personal information is
automatically integrated in the software, so everyone knows how to reach
you by phone/fax or email and where to sent the check/money or cash orders.

Basically this is the concept. Offcourse you need the software to grasp
the whole thing. Believe it, there is absolutely no marketing knowledge
required, just ask for the software package, join and start promoting your
own TUFF'97 line. The only thing you DO need is a PC or Mac(*) and Internet.

(*) TUFF'97 is only available for MacOS users running Connectix VirtualPC
or Insignia's Sofwindows 95/3.11. A true MacOS version is not available.

When you're interested in becoming a TUFF'97 distributor and create your own
distribution line, sent a mailto:FiReStArTeR@frodo.com and ask for your
copy of the TUFF software (We'll sent you a download location and install
instructions). This is a serious opportunity, so only serious responses
are processed. If you're not interested, have a nice day.
Best Regards,
Tony Scott

> Matthew Winter
> Email : matthew.winter@virgin.net
> 'Time, nothing beats the time wasted creating signature quotes'
>--

Hi Matthew.

It actually only involves making up a special lead - obviously it becomes more complicated if wish to switch between Low/Med and High resolutions. The only problem is that PC monitors do not have an internal speaker, so you will have to do without sound.

All you need to do is check the Hsync and Vsync rates printed on the back of the monitor, but nearly all SVGA monitors can display all 3 ST resolutions.

If you want, I'll see if I can dig out some diagrams for you....

Mark.

1867. Re: mint for 68000

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-14 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <W7INCFD@tos.pl.net>
Source record: 16654

Looking at all the replies to this thread, there seems to be a great deal of incorrect information being posted.

To clarify things, MiNT will work on the 68k and it does not matter whether it is named mint.prg or mintnp.prg. Memory protection is not possible on the 68k under MiNT.

If you have an '030, MiNT supports memory protection. This prevents apps from accessing memory that does not belong to them. To enable memory protection, MiNT must be named "mint.prg". If you find that you don't want memory protection for some reason, naming MiNT as "mintnp.prg" will cause memory protection to be turned off. Normally memory protection will enhance the stability of the system.

Contrary to some of the comments, memory protection does work, although sadly some apps do not work well with it since they need to access memory that they do not own in normal operation. In such cases the apps should set the memory to be globally accessible, or use shared memory, but some apps fail to do so. In this case, you can change the memory protection flags of the problematic app so that its memory is always globally accessible. (There are also other memory protection options that can be set individually for each app.)

There is also a new name for MiNT to cope with virtual memory (VM). Naming MiNT as "mintnp.prg" enables VM while "mint.prg" enables memory protection but not VM and "mintnm.prg" does not enable memory protection or VM. Unfortunately there is no way of enabling both memory protection and VM at the same time. BTW, I have found MiNT VM to be very unstable on my TT, and I understand that VM does not work at all on the Falcon, although other peoples' experiences may differ.

I hope that clarifies things.

%: > whether or not it supports 68000 chips!

%I'm not a mint head just yet...I've only played with it once or twice,
%but "I THINK" you can run any of the MINT kernels on the ST or STe as
%long as you name it MINTNP.PRG in your auto folder. NP in the name tells
%it to disable memory protection, which the M68000 obviously can't do since
%it doesn't have the MMU properties built in. Actually, I'm not even sure
%that Protected Mode works at all...on any machine...as everything I've
%tried on my Falcon requests that MINT be booted NP in the docs.

MiNT is smart enough to figure out what kind of CPU it's running on, and turn
off whatever features aren't available. (Although, it is possible to compile
it with some compatibility features explicitly turned off.)

And yes, the memory protection does work. Unfortunately, naive programs that
try to patch system traps and other system memory don't get along with it.

>file format of some sort (preferably .tif)? If so, what is this method???
>

Hi David,

At my knowledge there are two methods to print Calamus SL directly to
tif.

*The first one is rather expensive. With the printerdriver tiff.cdt
you can make a tif picture of a whole calamus doc. This picture can
then further used on other platforms.
The driver can be obtained from Adequate Systems, Germamy (400,-DM)
You can find more information about the driver on their website
(German/English/French)
http://www.geld.com/as/
You can download a demo version from their site.
I don't know if there excist a English version. Maybe you can try
MGI, Canada.

*The second one is much cheaper. With the Bridge module you can
convert whole pages into pcx, tif, iff, gif, img e.a. in whatever
colordepth you want (depending of the graphic format you use
ofcourse).
This module comes from MGI. I don't know the price but I should be
much cheaper then the tiff driver

Hope this help
Martin

Well I hadn't thought about running X-windows on it - but now you mention
it, I'll have a go at using it as an X-terminal :) I wa just thinking of
using it for running lots of telnets into the other machine. Two screens are
better then one (especially for debugging!)

> OH well...I'm new to MINT as well...I hope this helps a little. The
> TAF package mentioned earlier can be found at the hensa ftp site.

Okay - thanks for all the info.

To the best of my knowledge, you will be able to read Genesis/Mega Drive pads direction although the reading will be 45 degrees out (i.e. 'up' on the pad will be read as diagonal up.) This is easy to program for of course. As far as I know the Saturn's pads are completely incompatible.

1879. Using SLM804 laser with cartridge HD

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-16 00:00:00 UTC
From: Paul Lantz <plantz@onlink.net>
Message-ID: <01bc79f2$72e52e40$eafe6cce@paul.onlink.net>
Source record: 16664

A friend of mine, to whom I sold my old system, is having problems using the Atari 804 laser with it along with the Atari cartridge (44MB) HD.

Yes, I should remember how to hook it up but don't and she has lost the manuals (sold it to her 4 years ago and she hasn't used the computer for a couple of years).

Basically:

How are these devices hooked up?

computer-laser controller-HD

computer-HD-laser controller

We have tried all the combinations we can think of (by telephone diagnosis since she is 600 miles from where I live).

1880. Separate Keyboard avail for Atari?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-16 00:00:00 UTC
From: "Mr David.J.Nunn" <stu95djn@reading.ac.uk>
Message-ID: <Pine.SOL.3.95q.970616191000.27796D-100000@suma3.reading.ac.uk>
Source record: 16665

I own an Atari but would really appreciate having a separate keyboard,(slightly safer to spill coffee on).

I believe System Solutions(UK) sell a 'desktopper' system, but is there anything simpler, or cheaper. I ask in the hope that maybe you know of the modifications needed or could perhaps point me in the direction of a supplier.

I remember reading in the Atari press (a few years ago), about a simple device called D.E.K.A. 2 which would allow you to plug in a separate keyboard. Is it still available or maybe someone's willing to flog me one?

Dave Nunn, still trying to get use out of his faithful Atari.

Try good old Gemview. It can be found on most FTP sites.

1883. Terminal troubles on serial port

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-17 00:00:00 UTC
From: jmf@informatik.uni-koblenz.de
Message-ID: <5o5va7$n71$1@newshost.uni-koblenz.de>
Source record: 16668
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi there!

I connected a vt100 compatible terminal to my ST via the serial port. However, when I type process control characters like ^C or ^Z they are ignored by the shells (ash, ksh, tcsh). Strangely, the ^Y character (delayed suspend) has the effect the ^Z character is supposed to have, i.e. it causes the current process to stop. When quoting the control characters in vi with ^V, they are displayed so they must have been transmitted to the computer.

This is the /etc/ttytab entry:

```
ttya "/usr/sbin/getty vt100.9600" vt100 on remote secure
```

And here's the corresponding /etc/gettytab entyry:

```
V|vt100.9600:\
:sp#9600:ms=hupcl,isig,clocal:nl:im=:\
:hn=mounty:lm=\r\n%h console login\72 :
```

The stty -a command produces this output:

```
speed 9600 baud; rows 0; columns 0;
intr = ^C; quit = ^U; erase = ^?; kill = ^U; eof = ^D; eol = M-^?; start = ^Q;
stop = ^S; susp = ^Z; werase = ^W; lnext = ^V; min = 1; time = 0;
-parenb -parodd cs8 -hupcl -cstopb cread clocal
ignbrk -brkint ignpar -parmrk -inpck -istrip -inlcr -igncr icrnl -ixon -ixoff
opost
isig icanon iexten echo echoe echok -echonl -noflsh -tostop
```

Is this behavior a bug in the kernel or did I miss something in my configuration files?

Tschuess

I found that I have a Calamus driver which "prints" to GEM Image files. It
would be a simple matter to then convert this to TIFF format.

I am unsure where this GEM Image driver came from, however. The filename
was gemimg.cdt, so you could check for this in your Calamus SL
distribution. Otherwise, perhaps someone else knows about this driver.

Remember that if you want to use a PCMCIA card with the Portfolio you will need to get a PCMCIA adaptor first. Such things are available, although I don't have the address with me ATM.

In any case, the most likely way to access the internet with the Portfolio would be to have a simple terminal program and use "shell" internet service. I doubt that any SLIP or PPP software exists for the Portfolio, although I am unsure whether such software would be possible on the Portfolio.

You should be able to find the relevant software on one of the Portfolio ftp sites on the internet. Toad Computers (ftp.toad.net) have a mirror of such a thing, and some other Atari ftp sites (e.g. atari.archive.umich.edu) have Portfolio sections.

Word has been received that this year's MIST Atari show will be held on Saturday, July 26, in Indianapolis, Indiana. The organizers say this show, the ninth annual, will be the final one.

This year MIST is moving to the Post Road Community Center, 1313 South Post Road, on the east side of the Indianpolis area. The new location is between I-70 and I-74, outside the I-465 circle freeway.

Show hours are 10 am to 3 pm, Indiana time. Admission is one dollar. In past years this show has had displays by vendors, hardware and software developers, magazine publishers, and users groups. All kinds of Atari computers and related products can be found at these shows.

Organizers of the show are: Charlie Sears (317-535-4829), csears at doe dot state dot in dot us. Jeff Hammer (317-244-8492), jghammer at indyunix dot iupui dot edu. Stu Huffman (812-988-7558), shuffman at doe dot state dot in dot us.

Tos is still copyrighted, therefore it is theoretically prohibited to copy and distribute it freely. However, there are quite a few TOS images floating around the net. If you're clever and know how to use a search engine you should have no problem finding one.

HI!

P>Looking for a graphic converter that will convert Atari gem files to a
P>format recognizable on PCs.....
Which GEM-files do you mean? GEM-Metafiles (*.GEM) or GEM-Images
(*.(X)IMG)? If you want to convert files of the last type, then you can
use (nearly) every graphics-program (e.g. Stella, Papillon, Photoline).
If you want to convert *.GEM files I have no idea how.

Yes, I have it, too. It came with a fax-software package Q-FAX PRO.
There were two Printers for Calamus 1.09N. One is the IMG-gemimg.cdt,
the other is called CALFAX.CDT and makes a Fax-file from your Calamus
documents.

ONLY AVAILABLE IN THE:
U.S.A, CANADA VIRGIN ISLANDS, AND PUERTO RICO

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax,
pager, voice-mail, and cellular numbers and give them your New "Virtual Office"
800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone?
Wouldn't it be nice to be able to give everyone just ONE phone number that
will find you anywhere you are? Even out of town, or in a restaurant, or even
on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web sight:
http://www.mynumber.com

* Based on our best priced plan.

1898. TOS 2.06 in MegaST 2?

Hi!
I have a Mega2 equipped with TOS 1.04 in 6 EPROMs and I'd like to upgrade
this Machine to TOS 1.62 or 2.06. AFAIK the size of TOS 1.04 is 196kB (there
are 6 32kB EPROM's in my MegaST).
The size of TOS 1.62 and 2.06 is about 262kB. How is it possible to get these
Versions running in a MegaST (I've seen a couple of Mega's running TOS 2.06)?
262kB won't fit in 6x32kB :-(
Can I just burn it into larger EPROMs or what else do I have to do?

Please reply also via eMail because my Newsfeed is _very_ bad...

Thanks in advance

Martin.

1899. CLab Mk2 Limited Edition

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-19 00:00:00 UTC
From: Bo.XK.Leuf@trab.se
Message-ID: <33a91f9d.1760511@news>
Source record: 16684

Here's a mystery, any ideas?

Installed an IDE drive in a CLab Mk2 LE (Cubase Audio) which has an internal Toshiba SCSI. On its own the SCSI works fine. On its own, the IDE works fine. But when active together, attempts to read files from the SCSI gets "data might be damaged" on maybe half the tries. No problems at all accessing the IDE.

Edge and the like simply go nuts trying to analyse the SCSI partitions while active together with the IDE. HD-Driver (disk-booted) won't even recognize the SCSI drive then, while ICD manages ok. Seemingly only half the SCSI's FAT tables are readable when both drives are active together.

As I say, any ideas?

I don't think you'll need to burn anything!

First of all, TOS 1.6 and 1.62 are STE only TOS versions, and will not work on a "non-E" ST. So TOS 2.06 is your best chance. There is a way of fitting 2 chip TOS 2.0x into 6 chip machines that is described at:

ftp://home.mtholyoke.edu/users/kellis/atari/tos206up.txt

It is for STFs, but I don't think it should be any different for a Mega ST.

If you don't feel too confident about soldering, there are Bi-TOS upgrade kits available that will allow you to upgrade to TOS 2.06 and keep the compatibility of TOS 1.4 (with a little switch) for programs that need it. 2.0x has some downward compatibility problems with some games.

1902. Formatting 1.44 disks to 720K

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-19 00:00:00 UTC
From: Guentcho Skordev <ut13@ab281.rz.uni-karlsruhe.de>
Message-ID: <5obc9q$s7u$2@nz12.rz.uni-karlsruhe.de>
Source record: 16687

Hello,

I have great problems with the data transfer, because I didn't want to buy 720K diskettes (they are hard to find and have a greater price) and tried to use 1.44M (already formatted to 1.44) diskettes instead. I had the following problems (*which I don't have with real 720K diskettes!*):

- Some PC's don't want to format the diskettes to 720K or do it with a lot of errors. There is probably nothing to do about it. But read the next two.
- Some PC's format all diskettes succesfully, but the Atari can't read them.
- The Atari can format only about 1% of the 1.44M diskettes, and if it goes, they are physically unreadable on some PCs. I've tried to format disks with a CPX utility that shows the track number, abd i saw that it formatted almost all tracks (from 80 downto e.g. 2) and then there was an error message.

Has anybody experience? Is it possible to tune the Atari Mega ST floppy, or I will break it, if I try? Will it be better with unformatted diskettes (but I can't find them either).

Regards.

Guentcho

Do you put some black tape over the HD hole on the disks ? There is a hole,
opposite to the write-protect tab on HD disks. Some ST and PC drives require
it to be blocked in order to use them as DD disks.

I do this with my 720K formatted HD disks, and have not had any problems.

Should an Atari 1040 ST run with a Philips Type 14 Monitor, if so
should it be able to run Cuebase which requires a high res monitor? Any
info gladly received
Steve

1907. Atari Computers For Sale!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-19 00:00:00 UTC
From: bensmith@linda.teleport.com
Message-ID: <5ocja8$b92$1@linda.teleport.com>
Source record: 16692
Cross-posted to: pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

I've been recuperating from serious depression & treatment at a Mental Hospital. I've still got bills to pay, so I'm going back to work in a limited capacity. Selling Atari in the U.S. I can handle. But for now, I'm cutting back on selling abroad as it's hard enough when I'm in good shape. So I'm dealing with depression in the usual way. 1) Don't make promises I can't keep. 2) Only set goals within my reach. 3) Commit myself to taking weekends off and keeping my mind off of work. Lessons we could all learn.

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

You'll need a monochrome Atari monitor for Cubase or an adapter and
one the multisync(I don't remember the makes and models). I have
a SM147 mono that I would sell (dark gray with tilt swivel base)
for $100. I know it sounds like a lot but try to find one. You
could probably pick up SM124 (old style) for around $40.00. The
Atari mono monitors run in VGA mono mode if I remember.

1913. Diagnosis on unstable machines

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-20 00:00:00 UTC
From: Oliver Skelton <skelton@gatwick.geoquest.slb.*no-spam*.com>
Message-ID: <5od3k4$kda@ohnasn01.houston.omnes.net>
Source record: 16598

One of my machines which had an accelerator fitted is unstable. Some days it works fine, but others it repeatedly crashes - not obviously temperature related. The kind of fault which is probably very hard to fix. It often seems that it would even be better to make it worse (repeatable fault) rather then leave as it is with the machine too dangerous to use.

I know going around with a spraycan of coolant is one thing that can be tried. I was wondering if there were some other environmental tricks which might help:

e.g. a voltage sensitivity test:
Vary input voltages by +(say) 0.2 volts and -0.2 volts and see if that would improve or reduce reliability.

Or another thing I have wondered about is whether some of the noise in a machine which corrupts signals is induced interference... I am not too clear on this... but I imagine radio waves emanating from some components and bouncing around the case and inducing noise in other components. What is the effect of removing shielding? Does it increase or reduce induced interference inside the case?
Could some material be introduced which absorbs radio waves?... perhaps a partially conducting metallic honeycomb or something?
Are capacitative effects another thing one could play with?

Are such variable faults most likely to be due to poor conductance/bad solder somewhere, or may they be some flaw deep within a chip?

Expert use of an occiloscope might be another way to approach the problem.. but with erratic problems it can be very expensive to have a shop try to find the cure... is it practical to but or lease an occiloscope and learn how to use it?

Any ideas welcomed!

A good source for Falcon mods is TITAN's web page.
They have a document covering most of the mods needed on the Falcon,
in connection with their Nemesis accelerator board.
get the nem_man.zip(Nemesis manual) at
http://ourworld.compuserve.com/homepages/TITANWEB/download.htm

ONLY AVAILABLE IN THE:
U.S.A, CANADA VIRGIN ISLANDS, AND PUERTO RICO

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax,
pager, voice-mail, and cellular numbers and give them your New "Virtual Office"
800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone?
Wouldn't it be nice to be able to give everyone just ONE phone number that
will find you anywhere you are? Even out of town, or in a restaurant, or even
on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web sight:

His $200 price may be a little bit high, in my estimation, but why do you
think that a 1.7gig Maxtor SCSI hard drive would not be worth more than $20?
Why do you call this hard drive a "bookend?"
Do you know something that I don't know? Please enlighten me.
Thanks
Jerry

$20.00 for a 1.76 gigabyte drive? Who crapped in your corn flakes, that
you need be such a jerk? $200.00 is not unreasonable for such a drive,
including the power supply and case.

Leslie

Have the MIDI.PRG from the HSMODEM package after the DRVIN too, if you wanna
do networking with the Midi port using STinG ;-)

>
> I do this with my 720K formatted HD disks, and have not had any problems.

But you will have soon. Data lifetime is significantly shortened. Try to
read some disks you wrote to this way some time ago.

HD and DD disks use a different material for the magnetic layer, and corres-
pondingly need a different magnetic bias when written to, and read from, them.
DD drives are not capable of providing this bias, thus the data will fade rather
soon. HD drives will apply the correct bias if they're set to self-recognize the
disk type from the HD hole (and if nobody had taped it of course), and if set
to also apply this information ! This is an issue for MSDOS on PCs, where the
formatter (the PC) will tell the drive to use either HD or DD bias. So on PCs
the hole is useless, and it relies on the user to do everything right.

>> Has anybody experience? Is it possible to tune the Atari Mega ST floppy, or
>>I will break it, if I try? Will it be better with unformatted diskettes (but
>>I can't find them either).
>
> I think it would be the same.

The same, but bad too.

There is only one good advice : Stick to DD disks for DD formats (720k or similar),
and use HD disks only if you use all, a HD drive, a HD format (1.44M or similar),
and a machine capable of HD operation (an issue for old STs).

Cheers Peter

Why do you feel compelled to post such an insulting remark? (in both
newsgroups). Around here, Gig+ HD's sell for hundreds of dollars, so this
doesn't seem to be an outrageous asking price. Is there something
drastically wrong with Maxtor drives? Or is there something drastically
wrong with you? More info, please, or else go play with Sincrap.

Hi there!

I know nothing about Unix etc, but I think you'll find the ^Y problem is
due to your German keyboard, which has Y and Z transposed from the English
language ones! The program probably reads the scan-code rather than the
ASCII value. I have come across this quite often when translating German
programs, and have to alter ^Z to ^Y and vice versa. In one or two
instances this doesn't work because the program reads the shortcut from the
resource file but still reacts wrongly; then I have to choose another
letter entirely!

In <5od3k4$kda@ohnasn01.houston.omnes.net> Oliver Skelton wrote:

>One of my machines which had an accelerator fitted is unstable. Some
>days it works fine, but others it repeatedly crashes - not obviously

In most of all you only have trouble with the ram access.
(Only with a cpu accelerator and also)

Try again without accelerator! ;-)

The problem of some accelerators is to swich up and down the clock.
If your cpu don't work on the bus, she's working with a high clock speed from
the accelerator board. All few nS that cpu clock MUST be switch down while cpu
have access to the external bus. If that accellerator can't found that 'switch' point
on a exact corner of the cpu clock wave, you get a 'unstable' machine.

```
...
. .
..... . .......
. .
. .
^
|-- 'switch' point
```

The next point of trouble is to compare the switch point of your accelerator
and to find the exact point for a 'switch' on clock's waveform..
So we have in some machines a extra hardware (a single chip)
We take the original signal from the board an fill it into some gates in that chip.
Remember: The signal will lose some nS of time in evry gate..

I most of some, that 'patch' are lucky enough to hit the exaclty 'switch point' in 100%
(And it's 'sharpen' any corner of the clock wave)

Witch machine do you have. It's a Falcon?

regards, robert

The problem is that when you use FTP in binary mode, the transfers are in 8
bit mode. ASCII is only 7bits wide. So each byte in your file is missing a
bit! There's no way to convert from 7 bits to 8 bits.

You just have to go back to where you found the file and do the transfer
again. Make sure you set your FTP to binary this time (if it's a text mode FTP
client, just type 'bin' before 'get').

No way! The codes must be transmitted correctly, because when I quote
characters in the vim editor they are printed correctly. Besides, the C-key of
the German keyboard is at the same position as the C-key of the US/UK keyboard.
The only yhing that worries me is that the special process control meaning of
some of these keys is not recognized.

>The program probably reads the scan-code rather than the

That may be the case with some programs, but the programs I'm talking about are
mostly Unix ports that don't bother with scancodes but read the characters
transmitted via streams/ports.

In article <33aebabe14b2fe3@sn.no>,
hallvart@sn.no (Hallvard Tangeraas) writes:
> Oh no, did you have to post it in this group as well???!!
> When will people understand that binary messages aren't welcomed (unless
> they're very small) in newsgroups, except for the "binary" groups ofcourse.
Not forgetting that the program is not very useful, as many texteditors
already offer the conversion of "umlauts". qed (and maybe others as well) is
even capable of more, e.g. ISO, HTML, etc. Or does his program convert
ASCII into the "one-paragraph-in-one-line"-format that some PC programs use?

Ciao

Thomas

Hi there!

You _should_ be able to get DD disks in most computer shops and larger
stationers, I would have thought. Certainly you can in the UK, and I
would have thought in Germany too.

> - Some PC's don't want to format the diskettes to 720K or do it with a lot
>of errors. There is probably nothing to do about it. But read the next two.

AFAIK, all PCs should be able to format DD from DOS with FORMAT A: /F:720
and the Atari should be able to read these.

> - Some PC's format all diskettes succesfully, but the Atari can't read them.

Very strange - it should!

> - The Atari can format only about 1% of the 1.44M diskettes, and if it
>goes, they are physically unreadable on some PCs. I've tried to format disks
>with a CPX utility that shows the track number, abd i saw that it formatted
>almost all tracks (from 80 downto e.g. 2) and then there was an error
>message.

It seems to me that your formatter is somehow reading the existing format?
I format HD disks with my STFM all the time and have had no problems -
though I have now fitted a replacement HD drive which is available for
around £12 - £20 (but I don't have the hardware mod to use HDs _as_ HDs)
and haven't tried the disks later on PCs. With TOS 1.04 and later you
should be able to format from the desktop in an IBM-compatible way, or
there are progs that will write an IBM root sector to disks (IBMBOOT, I
think). Try Fcopy 3, that can also format in an IBM-compatible manner.

I also used to format HDs with the original DD drive, but I understand
that HD disks should not be used for important data etc like this because
they have a higher coercivity magnetic coating that really needs a higher
write current than DD disks, and the DD drive won't provide this. The
result is a 'weaker' magnetisdation that may not be as reliable.

HTH

It's ICTARI time again !

Get thee to:

http://www.elis.demon.co.uk/ictari/ictari.htm

and have a read of ICTARI 47.

Those of you who've been reading up on OLGA and the like in
Atari Computing will be intesested in the huge chunk of GEM
documentation in ST-Guide format. As for next month, I don't
know.... Send me something ?

Have Fun,

Giles.

SS>>
SS>> For use with:
SS>> Falcon/NVDI/Pagestream/Positive Image/APEX.
CR> HP Deskjet 660C (used with SpeedoGDOS-driver for HP550C) is doing

There's an HP660C-specific SpeedoGDOS driver around on many ftp sites, the
config CPX is in French BTW.

It's also possible to use one of the LaserJet drivers to give 600*600dpi in
monochrome, also it's quite easy to modify the NVDI 550C driver to give the
higher mono res.

Speak to 'ya later!

If wordwriter can export plain text (ASCII), then at least you won't be
retyping anything, but you'll lose all the formatting.

You could try Marcel on the ST which is a freeware WP that can read/write many
formats (not sure about wordwriter), and can export RTF.

That's for the conversion. To physically transfer the files from the ST to the
PC, just use a 720K disk formatted on the PC.

1. Works OK with Falcon,
2. 4 full size exposed bays, the lids are detachable (it has the 4 lids),
3. Internal ribbon cable with 4 SCSI 50 pin connectors.
4. 230 Watts power supply (110/220V),
5. 2 additional internal fans,
6. External SCSI ID selector for each one of the drives.
7. Resistor built in (starts the power supply even if the load is small),
8. Case color: cream. AC power cable, good condition, LED on indicator.
9. Two 50 pin SCSI centronics connectors (IN/OUT).
10. All you need is a 50 pin Centronics to SCSI 2 cable. (Falcon)

$80 obo.

Hard disk case for Atari: PLUS IMPULSE SUPRA

1. DMA in/out connectors.
2. The case will hold 2 physical SCSI units.
3. Slender design will fit OK under monitor.
4. Will ship with latest utilities on a 720K disk.
5. Color: cream
6. Includes DMA cable and power supply cable.
7. 3 indicator leds at the front.

$50 obo

I also have an SH204 (Atari) ST hard disk $70.

Buyer pays shipping. Send COD. Phil.

Which accelerator is this?

Was it a DIY installation?

If it is easily removed you could check that it isn't a problem with
the base machine.

> I know going around with a spraycan of coolant is one thing that can be
> tried.

I think that's more useful with analogue circuits.

You could try just touching the processor and other ICs with your finger,
should soon tell you if anything is overheating.

> Or another thing I have wondered about is whether some of the noise in a
> machine which corrupts signals is induced interference...

Long wires can pick-up interferance.

> Are capacitative effects another thing one could play with?

AIUI Titan use capacitors to dampen noise on the Falcon.

> Are such variable faults most likely to be due to poor conductance/bad
> solder somewhere,

Could be a dry solder connection, or a poor connection of an IC in
it's socket.

> Expert use of an occiloscope might be another way to approach the
> problem.

I once watched an engineer use his scope in this way - he found 3
faults on a hand built board in a matter of minutes, but then he was
already an expert and knew what he was looking for.

Good News For RGB Monitor Users!!!!

A new product, the VideoTurtle from Turtle Enterprises, is now
available! This product converts RGB known as TV RGB, into S-Video
signals. Replacing the need for an older TV RGB Monitor.

ANY SYSTEM, that outputs TV RGB, can use the VideoTurtle. Some of the
many are:
Sega Genesis/32X/CD-ROM
Amiga
Atari ST
Neo Geo
Apple IIgs
MSX II/MSX II+
Adam
Commodore 128
TV RGB Monitors(for uses other than computer/video games)
Video Arcade Games, ones that output RGB.
IBM CGA

Please, no flaming! If interested in the VideoTurtle from Turtle
Enterprises, please email me-ab453@cleveland.freenet.edu

Thank you!

TOS is still under Atari's copyright, so there is no free distribution.

If you want it for an emulator, there are plenty of pirate TOS images floating around. But I won't tell you where.

Nick

1971. Atari Computers For Sale!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-06-27 00:00:00 UTC
From: bensmith@kelly.teleport.com
Message-ID: <5p1lflgst1@kelly.teleport.com>
Source record: 16556
Cross-posted to: pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

I've been recuperating from serious depression. I've still got bills to pay, so I'm going back to work in a limited capacity. Selling Atari in the U.S. I can handle. But for now, I'm cutting back on selling abroad as it's hard enough when I'm in good shape. So I'm dealing with depression in the usual way. 1) Don't make promises I can't keep. 2) Only set goals within my reach. 3) Commit myself to taking weekends off and keeping my mind off of work. Lessons we could all learn.

I have some Hard Drives I got directly from the Shadow of Shadow SoftWare. He says they've worked since they were pulled from their Computers. These are $25 each as is. They are MFM or RLL. E-Mail: bensmith@teleport.com or call Ben at (503)256-9974

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to

for Help.

Dear Internet user,

If you are paying for your Internet services
then you have not heard about 1stFamily.
We have a marketing method that guarantees
you will not have to pay one dollar to access
the internet.

* You will never again have a busy signal !

* You will always have the fastest access you have ever seen !

* Risidual income for the rest of your life !

* and much much more.

This opportuinty is for YOU to take advantage of !

Do you wish to continue the rest of your life paying $19.95/month to
access the Internet when you can access it for free with
speed and reliability that exceeds the other competitors ???
We did not think so. That is why our company is the best and fastest
growing of it's kind and will soon compete with AT&T and MCI and
all the big companies in providing Internet Service.

For complete information please mailto:sameer@1stfamily.com and
type "More Info" in the subject box.

You will recieve our webpage address where you can get inrolled in
seconds !!

I recently aquired an Atari Portfolio and have unsuccessfully attemped to
transfer files to it via the Parallel port on my PC. I have the FT
software on both units, and when I tell one to transfer and the other to
recieve, they both just sit there saying "waiting for connection."
Can someone help me out with this?

Thanks,
-Kevin

ONLY AVAILABLE IN THE:
U.S.A, VIRGIN ISLANDS, AND PUERTO RICO CANADA*

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax,
pager, voice-mail, and cellular numbers and give them your New "Virtual Office"
800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone?
Wouldn't it be nice to be able to give everyone just ONE phone number that
will find you anywhere you are? Even out of town, or in a restaurant, or even
on the golf course.

Now you can.

We have the answer to all your communication needs. It's called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That's less than one phone line would cost per month.

For more information please visit our web site:
http://www.mynumber.com

* Based on our best priced plan.
* Canada has a higher per minute rate.

From: Dave <dave@moocow.u-net.com>
Message-ID: <33B6A009.6DA8@moocow.u-net.com>
Source record: 16568

Greetings

I am trying to receive a small sample dump into the ST via MIDI - all goes well until it receives 128 bytes at which point the data becomes muddled.
I assume the MIDI buffer is 128 bytes and so fills up and the remaining data overflowing.

Is this correct? and how do I get around this problem? I am using GFA Basic and compiling it for speed. Both of which produce the same results.

Any suggestions?

Regards Dave

If you're talking C-Lab Falcons, that's it, except the MkI has 4Mb
memory and the MkII has 14Mb. Mine is a MkII, steer well clear of it
if you ever want to attach a second SCSI device as C-Lab didn't really
take that into account when they made their modifications.

You can find a pinout of the standard SCART/Peritel connector, and a pinout of
the ST monitor port. Then just connect the two. Try these two links

http://www.mindspring.com/~kjack1/scart.html
and
http://www.teleport.com/~atari/STinternals.htm#MONITORPORT

Hi,

Talk to the kid at B&C Computer Vision. He had an SC1435 connected to a VCR
at the Sacramento Atari Show last year. Don't know what he did, but it looked
pretty cool.

I used the Expose Video Digitiser Splitter connected to an SVHS camera and an
SC1435 and it worked fine.

Hey I wonder what a video splitter does? Maybe it splits up the composite video into RGB?

2001. Re: HELP - MIDI port programming

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-03 00:00:00 UTC
From: prajoux@laas.fr
Message-ID: <5pfslo$jv4$1@laas.laas.fr>
Source record: 16586

In article <33B6A009.6DA8@moocow.u-net.com>, Dave <dave@moocow.u-net.com> writes:
>I am trying to receive a small sample dump into the ST via MIDI - all
>goes well until it receives 128 bytes at which point the data becomes
>muddled.
>I assume the MIDI buffer is 128 bytes and so fills up and the remaining
>data overflowing.
>Is this correct? and how do I get around this problem? I am using GFA
>Basic and compiling it for speed. Both of which produce the same
>results.

I don't have my docs with me, but from memory the MIDI buffer is larger than 128 bytes.
Also from memory, I think there is a legal way to install a buffer of your own,
of any size you like.

Anyway, I don't think your problem is at buffer level. Quite probably, it looks
like the problem of an array being accessed via byte indexing by GFA. In this case,
you can read only from index 0 to index 127. Maybe the data exists in memory,
because it has been stored using a different method, or maybe not, but in any case
you cannot read it beyond index 127.

If I am right, you should consider which types of array/variables you are using,
or which declaration. Sorry, I am not a GFA user, I cannot be more precise.

Hope this helps.

Roland.

2002. Again about 720 vs 1.44

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-03 00:00:00 UTC
From: Guentcho Skordev <ut13@ab282.rz.uni-karlsruhe.de>
Message-ID: <5pga6skcc2@nz12.rz.uni-karlsruhe.de>
Source record: 16587

Sorry for opening a new thread, but the things you and I wrote are no more on the server. Now I know it isn't a good idea to format 1.44M diskettes to 720K. This is an important information nowadays. Later I found it also in the New Atari ST FAQ (n_FAQ, the 2nd part). (I've got it from ftp://ftp.sn.no/user/hallvart/atari/info/n_faq2.txt) The reason I din't notice it before is there stays something like "Never format an 1.44M disk in a *double-sided* drive." IMHO it should be "double-density".

Bye
Guentcho

2003. SCSI Adapter for the Atari STE: commercial and DIY availability?

Newsgroup: comp.sys.atari.st.tech

Hi al,
I'm just wondering how to get my STE SCSI ready. Is there any cheap and
safe way to do it yourself?
Can anyone recommend some commercial stuff - please specify capabilities
and pricing.
Regards,
Daniel

Buy the Link96 - you can find lots of vendors for Atari stuff at my Web page (go directly to the Vendors page by tacking /vendors.htm onto the address in my .sig below); Link96 is made in Germany so it will be a local company you deal with, and it's a plug & play deal.

2005. Standard PC IDE Hard disk drives

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-03 00:00:00 UTC
From: woodster@enterprise.net
Message-ID: <33bc22ff.2583448@news.enterprise.net>
Source record: 16590

Greetings !

Does anyone know if you can attach a standard PC IDE disk drive to an STE 1040 by use of the 19-way D socket hard drive port on the back of the machine, like some kind19-way D-plug to IDE cable ?

TIA

Woodster

2006. Atari Computers For Sale!

I've Added more stock to my Atari catalogs. So check it out.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks, Labtec Speakers & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: 1040STF Computers, Spectre GCR Macintosh Emulators, MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Hard Drives, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Either the cable is bad or not a file transfer cable, or the parallel
port on the computer is not configured for or capable of bi-directional
communications.

2009. Increasing Falcon HD Space/SCSI Bus Timeout

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-04 00:00:00 UTC
From: "Jay T. Millar" <jmillar@eaglequest.com>
Message-ID: <33BD1C1E.67871039@eaglequest.com>
Source record: 16449
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hey All,

I haven't been in the Atari scene in a bit, so please cut me some slack. :)

I've got a Falcon I've installed Linux/68k on several times, but I keep running into the same problem:

My SCSI bus to my external drives always times out at the worst possible times during write operations
(very nasty problem for a UNIX system). I'm aware this is a known hardware problem with early Falcons,
and that there were things you could do to fix it, but I don't think I have the kind of time, motivation, or
resources to fix it permanently.

That being said, I'd like to increase my IDE harddisk space (whose interface doesn't time out) from the measely
80MB internal I've got in the thing. My true questions are these:

1) Can a run-of-the-mill EIDE harddrive which are so cheap nowadays be connected to the internal IDE interface
in some way? Provided I have the drive in an external case with its own power supply, would it simply be a matter
of running a new ribbon cable out of the Atari case? Are there any IDE communications problems with this setup?
How about Atari HD driver issues?

2) If I can't do #1, can I simply pick up another notebook size (2.5"?) harddrive and stuff it in the thing? I'd rather
do #1 because of the cost factor, but this solution seems the most straightforward answer to my problem. Anyone have any
recommendations where to buy these types of harddrives?

Well, thanks in advance for any advice! I'd really like to use my trusty Falcon030 in some productive capacity.
BTW, please respond via e-mail if possible.....

Probably the cable - the parallel port on the desktop does not have to
be bi-directional. You need an
all-lines-straight-through-25-pin-male-on both-ends-cable. The problem
is that it is very hard to get something like this - I know, I went
through it myself recently. I made a cable like this from parts bought
at Radio-Shack (where else). I bought a parallel file transfer cable
(or Laplink cable) but that is not what portfolio uses - the lines do
not go through straight.

Good luck
NUMER

2011. $$$$$ DO YOU HATE YOUR JOB? $$$$$

$50,000.00 for only $5.00 within 2 MONTHS?????
==========

You gotta be crazy! How on earth do you think you can buy 50 grand
for lousy 5 bucks? Well, that's what I was wondering, too until I
came across this letter.

First of all, IT'S PERFECTLY LEGAL! (Call 1-800-725-2161) if you
have any questions about the following opportunity to make
$50,000.00 and that probably WITHIN LESS THAN TWO MONTHS!

Well, here it goes:
A little while back, I was browsing these newsgroups, just like you
are now, and came across an article similar to this that said you
could make thousands of dollars within weeks with only an initial
investment of $5.00! So I thought, "Yeah, right, this must be a joke,"
but like most of us I was curious, so I kept reading. Anyway, it said
that you send $1.00 to each of the 5 names and address stated in the
article. You then place your own name and address in the bottom of the
list at #5, and post the article in at least 200 newsgroups. (There
are thousands) No catch, that was it.

I knew that that was the opportunity I had waited for for a long time.
I thought it was about time that the money of the world gets into the
right hands! OURS, right? I never had a doubt that this thing will
actually work and even if it didn't, what were 5 stamps and $5.00 for
a try?

As I mentioned before, like most of us I was a little skeptical and
a little worried about the legal aspects of it all. So I checked it
out with the U.S. Post Office (1-800-725-2161) and they confirmed
that it is indeed legal!

Now, that's how your story WILL sound like, too if you participate:

Well GUESS WHAT!!... with in 7 days, I started getting money in the
mail! I was shocked! I still figured it would end soon, and didn't
give it another thought. But the money just kept coming in. In my
first week, I made about $20.00 to $30.00 dollars. By the end of the
second week I had made a total of over $1,000.00!!!!!! In the third
week I had over $10,000.00 and it's still growing. This is now my
fourth week and I have made a total of just over $42,000.00 and it's
still coming in ....

Let me tell you how this works and most importantly, Why
it works....also, make sure you print a copy of this article NOW, so
you can get the information off of it as you need it. The process is

very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

#1 Robert Jezil
114 Jefferson Ave.
Slidell, LA 70460

#2 Phil Walther Jr.
9495 Annapolis Lane North
Maple Grove, MN 55369

#3 C. E. Burkman
170 University Ave. W
Suite 12-129
Waterloo, Ontario
N2L 3E9

#4 A. Bailey
1207 Reeves Road
Plainfield, IN 46168

#5 J. Martin
P.O. Box 2292
Reston, Va. 20190

STEP 2: Now take the #1 name off the list that you see above, move the other names up (2 becomes 1, 3 becomes 2, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following:

FOR NETSCAPE USERS:
1) Click on any newsgroup, like normal. Then click on "To News", which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (remember to add your name to number 5 and move the rest up)

4) When your done typing in the WHOLE letter, click on 'FILE' above the send button. Then, 'SAVE AS..' DO NOT SEND YOUR ARTICLE UNTILL YOU SAVE IT. (so you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your first copy! (click the 'SEND' button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'. Click on attach file then find your letter wherever you saved it. Click once on your file then click 'OPEN' then click 'OK'. If you did this right , you should see your filename in the 'ATTACHMENT BOX' and it will be shaded.

NOW POST AWAY!

FOR INTERNET EXPLORER:
It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

Go to the newsgroups and press 'POST AN ARTICLE' type in your flashy subject and click the large window below. Press 'CTRL' and 'V' and the article will appear in the message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.** Now re-highlight the article and re-copy it so you have the changes.... then all you have to do for each newsgroup is 'CTRL' and 'V' and press 'POST'. It's that easy!! THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for noncommercial use. To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you con invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now the WHY part:

This entire principle works because it is in a format of an upside down tree with thousands of branches. Everyone below you will see to it that the tree continues because they want to get money. Those below THEM will continue because THEY want to get the cash etc.

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM of 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00
at #4 $225.00
at #3 $3,375.00
at #2 $50,625.00
at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 and start posting again.
The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! And this will go on and on and on and on.... get the picture? Well, there's 5,000,000,000 people on the world and most of them will eventually end up being hooked into the internet. So there are virtually unlimited resources. Of course this will work the best at the very beginning so the faster you post, the better for YOU!

So can you afford $5.00 and see if it really works?? I think so! People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also.

Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income. Thanks once again...

Nope. Don't even think of it :-(

Connection of SCSI devices is easy - IDE NOT!

Yes. get HD Driver (almost up to version 7.0) and you can attach
2 IDE(or EIDE) drives. I would keep the cable length as short as
pssible though. I think CBHD can do this also, but I've no experience
with it.

I myself went for this option. I put in a 280$ 1.3GB 2.5" IDE hard drive
inside my Falcon. Get an notebook hardrive, a used notebook drive
would be the best price wise. 25" drives are getting less expensive.

Source record: 16456
Cross-posted to: alt.steinberg.cubase,comp.sys.atari.st.tech

How do I listen/play stereo samples?

1. I imported an stereo sample using the pool,
2. Set one of the audio tracks to "any"
3. Then dragged the sample to the arrange window (the main screen).

Cubase plays it ok but MONO. Using the Audio Monitors, I can see
that the stereo sample is there playing (because the volume level
between channels changes as the sample is played, this is ok since the
sample is a sound going L-R) but somehow, the outputs are mixed to mono
as I can hear and see using the audio monitor (on this machine, all other
stereo programs work fine).

How do I play an stereo sample in stereo? Thanks!

Not with that port.
Use a dma to scsi hostadaptor to connect a scsi-drive.
(Have a look to LINK '96/'97)

For ide you have a chance only with a internal extra board.
You have a lot to solder.

regards, robert

No. Dangerous. That's a DMA socket, aka ACSI, a sort-of cut-down SCSI.

Forget IDE, get a SCSI hard drive and a SCSI host adapter (the Link II or
Link 96 would be easiest).

Check with toad (sales@toad.net) or Computer Direct (info@compdirect.com)
for North American sales/availability info.

I recommend the LINK96/97 adapter by WB Systemtechnik. It's the only
SCSI hostadapter for the Atari that supplies initiator identification.
This means that only with the LINK96/97 adapter you can use any kind of
SCSI device with the ST/STE, including Quantum Fireball drives.

No there's no such thing. For external drives, you need a DMA/SCSI adapter and a SCSI drive, not IDE.

There are adaptor cards for IDE, but they are mounted on the motherboard and are for internal drives. The problem is that you need to get either a 2.5" internal drive or a PC desktop case for the ST+drive if you want to mount a 3.5" drive. A 3.5" won't fit inside the standard ST case.

No you can not connect a IDE drive to that port.
You can only connect a SCSI drive using a hostadapter to that port.

You can make an adapter for a PC bus-mouse:

From: Michael Parrott <mparrott@kendaco.telebyte.com>
Newsgroups: comp.sys.atari.st
Subject: Connecting a PC mouse to Atari ST

Enough people have asked that I've assembled some instructions for
modifying a Microsoft Mouse (Bus Version Only!) to work with an Atari
ST/STE/TT/Falcon. I have only tested this with the Microsoft Mouse II,
but it should work with any mouse/trakball designed for a bus interface
card on a PC. Included are general instructions for modifying the PC Bus
mouse itself and for building an interface box which will allow any PC
Bus mouse/trakball to be connected to an Atari ST/STE/TT/Falcon without
further modification. Any particulars mentioned herein can easily be
modified to fit whatever situation you may find yourself in - at least
with respect to making a PC Bus mouse work on your Atari.

First, a NOTE: I am not in any way, shape or form responsible for any
harm that may come to you, your computer, your mouse or other controller
device, or anything whatsoever, through your use of the information
contained in this file. While I believe all of the information to be
accurate, I make no guarantees as to its accuracy and have no guarantee
that you will perform everything in a safe manner or according the
instructions provided. So you're on you're own here; however, it did
work for me.

STUFF YOU MIGHT NEED FOR THIS PROJECT:

(items with "+" are for building the box)
(and may not be needed if you plan to)
(modify the bus device directly)

- Bus Mouse/Trakball + Electronics Project Box

+ Coffee, tea, soda, milk, water, beer, hard liquor,
Everclear or whatever liquid refreshment/stimulant
you feel necessary to continue

- Atari Mouse Cord (recommended) -OR- joystick cord with all 9
wires -OR- nine-wire conductor and DB-9 connector

- Solder & Soldering Iron + Hot Glue Gun & glue sticks

- Ohmmeter/Multimeter + Drill

- No. 1 Philips and Slot screwdrivers

+ Aspirin or Non-aspirin pain reliever (just in case)

ON WITH THE SHOW

Here are the pin and signal assignments for the PC Bus mouse and Atari mouse connectors:

Bus Mouse Signal		Atari Mouse
1	Ground	8
2	Rt Btn	9 (Right Button)
3	--	-
4	--	-
5	LftBtn	6 (Left Button)
6	YA	3 (Vertical Cursor)
7	YB	4
8	XA	1 (Horizontal Cursor)
9	XB	2
10	+5v DC	7

Note that, as it pertains to this modification, pin 5 is not used on the Atari connector, pin 3 does not exist on the Bus connector, and pin 4 on the Bus connector is not used.

Looking in from the business end of the connectors (i.e., the part that normally plugs into the computer), the pins are labeled as follows for the purposes of this mod (this may or may not match any standard numbering conventions):

Bus Mouse Atari Mouse
--------- -----------

Note the blank area at the top of the "Bus Mouse" figure. This is a "key" of sorts to prevent improper insertion of the plug, and is a handy way to differentiate between a Bus plug and a PS/2 plug, both of which are round. Another way to tell the two apart is the Bus configuration has ten places for pins, while the PS/2 configuration has only 6 pins. YOU MUST USE A BUS MOUSE/TRAKBALL FOR THIS PROJECT TO WORK. Serial, PS/2 and MousePort mice do not have the proper signals to work with the Atari mouse port.

BEFORE GETTING STARTED:

There's several ways this mod can be done, and you'll want to prepare for each a little differently. The first step, of course, to read over all the instructions carefully and make sure you understand them before proceeding.

Obviously, the mouse/trakball has to plug into the Atari. The best way to do this is to use the cord from an unused Atari mouse. The second best way is to use a DB-9 connector, which can be attached directly to the cord of the bus mouse, or to an un-used Atari mouse cord which can then be patched to the bus mouse. Note that the mouse cord MUST HAVE ALL CONDUCTORS AVAILABLE with the exception of pin 5. Not all mice use the same number of conductors, and many have simply left the unused conductors out of the cord. You must use a cord which has the required conductors (1-4, 6-9) available for use. Joystick cables with the required conductors will also work, but are not as flexible as mouse cords; the same is true of most other cables you might make up yourself.

To simplify things later on, you might go ahead and determine which wire in the cable(s) are connected to which pins. Each wire should be a different color, which makes it easy to create a table listing each wire color and the pin it goes to. If the wires are all the same color, simply label each wire with a piece of tape and the number of the pin it connects with. You can get this information either by opening up the body of the PC Bus mouse and using an ohmmeter to trace continuity; checking things out visually, or by using a very small divining rod and immense faith in your ability to use it.

TO MODIFY THE BUS MOUSE/TRAKBALL DIRECTLY:

Using whatever 9-pin connector/cable combination you have chosen to use, simply connect the pins/wires from the Bus mouse connector to the Atari mouse connector as described in the chart at the beginning of this text.

If you will be cutting the connector off of the Bus mouse cord and replacing it with an Atari/DB-9 connector, make sure you have already generated a listing of what color wires go to what pins! Otherwise you'll be hard pressed to tell which wires go where and may never get it working right.

Once the connections have been made, check all of them and if all looks well, plug it in and give it a go. Make sure to check out all functions of the mouse (cursor up/down/left/right, left/right buttons). If it doesn't work properly, refer to TROUBLESHOOTING below for some tips. If it does work, congratualtions!

TO BUILD A BUS MOUSE/TRAKBALL INTERFACE

If you have an un-used IBM bus card handy, it can be used to construct a plug-in box which will allow the use of any other bus controller (i.e., mice, trakballs or pen mice) without having to perform further modifications to equipment. The Microsoft Bus mouse comes with an 8-bit

ISA Bus card; if the PC Bus mouse you obtained did not come with a card and you do not have another, you might try obtaining just the 10-pin Bus jack from an electronics supply store or via mail order.

My box uses the card that came with the Microsoft Bus mouse. If one bends the metal bracket on the card parallel to each side of the circuit card and cuts the circuit card at the bracket ends, the resulting card will fit into most small electronics project boxes of about 2" x 2" x 3". I took the resulting card to a local Radio Shack and found a box that would fit for under $3.00.

Place the card into the box and determine where to drill two holes: A big one for the PC Bus mouse to plug into the card, and a smaller one for the mouse cord which will plug into the Atari.

Once the holes are drilled, use an ohmmeter to determine where, on the "chopped" circuit board, the pins of the jack can be accessed. This allows for easier connecting of the Atari mouse cable to the circuit card. Ideally there should be a row of un-used solder pads on the top of the circuit board, near the jack, which can be used for this purpose. Keep good notes and/or label the solder pads so you know which ones lead to which pins on the bus jack. Also keep in mind that the pin numbers on the jack are mirrored left-to-right, as compared to looking at the bus connector on the mouse itself.

Thread the end of the cable which will be leading to the Atari connector through the small hole in the project box so that the plug is outside the box and the leads are accessable within the box. Tie a knot in the cable about three inches from the ends of the leads to prevent the cord from being pulled out from the plug end.

Solder the appropriate wires of the Atari cord to the solder pads on the circuit card which match the proper pins on the Bus connector. Before connecting the box to the Atari for testing, double check all connections my using an ohmmeter, making sure the PC Bus pin-to-Atari pin assignments are correct.

Test the box by plugging the Atari connector into the computer and the Bus mouse into the jack of the circuit card, making sure to test all functions (left/right/up/down cursor; left/right click). If there's a God in Heaven and all is right with the world, everything will function properly. If it doesn't, take a look at TROUBLESHOOTING below.

Once you've verified that all works well, place the ciruit board in the project box so the mouse connector lines up with the hole drilled for it and hot-glue the circuit board in place using plenty of glue along the edges of the metal bracket. Pull the mouse cord to the Atari connector so the knot in the cable is placed against the inside of the project box, making sure the leads to the ciruit board aren't being stressed, and hot glue that in place as well. Before securing the lid to the box, make sure that the PC Bus mouse easily plugs into the connector in the box. Then secure the lid to the box, and you're good to go!

You now have an interface that should let you plug any standard PC Bus mouse, trakball or cheese grater directly to the Atari without any further modification. In other words, you won't have to do this again and won't have the excuse again later, so you might as well sit back and have that beer now.

TROUBLESHOOTING

Those making an interface box will likely experience the most difficulty, as it is easy to lose track of where on the circuit board one can make a good connection with a particular pin on the connector. Being careful and meticulous and using a "paper brain" will help avoid problems later on.

The first thing to do, of course, is to check all connections to make sure the correct pins are connected to each other, and check each connection to make sure it is electrically secure and complete. If this fails, try using some of the tips below, which is basically the same advice in table form: ;)

Symptom	Probable Cause	Solution
Mouse cursor movement problems.	XA/XB or YA/YB signals reversed (left moves to right, up moves down, etc.)	Reverse XA/XB signals for horizontal, YA/YB signals for vertical
Mouse cursor really hosed up (moves up, right, etc.)	XA/XB and YA/YB signals connected to wrong pins	Ensure XA/XB and YA/YB connected to proper pins as per PC Bus/Signal/Atari Mouse table
Right or Left button does not work.	Signals not connected _or_ are reversed. This can be checked by trying each button as if it were the other button.	Check pin-to-pin connections for mouse button signals; Check to ensure Lft Btn and Rt Btn signals are not reversed.
Any given function does not work.	Signal not properly connected.	Electrically check the connection for that signal; Check pin-to-pin connections.
All else fails.	Did not try, or did not try again.	Try again.

Set forth in electronic text for all posterity this 29th day of May, 1994, for the edification of the masses and to while away a few moments that would otherwise have made up a dull day,

Michael Parrott
mparrott@hebron.connected.com

Many thanks to everyone who's ever written anything whatsoever about modifying a bus mouse to work on an Atari computer, whether in textual or graphic format. I've tried not to draw directly from any other source for this file, but have surely been influenced by other information I've found on the subject, so thanks to those folk, whomever they may be, are definitely in order. So there.

Yeah, I just installed a new 1.08 gig drive inside my Falcon. I went with a Toshiba, because another Falcon owner had already confirmed that it worked (that and it was about the cheapest gig drive I could find). I've also heard Fujitsu, Conner, Seagate, Quantum and Maxtor recommended for internal Falcon drives.

As for where, I bought mine for $199 at COMPU.D (800-929-9333). I paid another total of $20 to have it shipped 2nd day (though I actually received it in less than ONE day, via Fed Ex). The total of $219 was at least as cheap as everyone else wanted just for the drive itself, without shipping. Needless to say, I recommend these guys very highly.

PROFILE 2 v2.21 *THE* Atari system analyser is now available.
This is a major upgrade on the v2.14 released 2 years ago.

This is *the* most comprehensive system analyser available and fully
compatible with all Atari machines and Atari emulators and operating systems
including MultiTOS, MagiC, MagiCMac, MagiCPC, Geneva, GEMulator, STonX,
PaCifiST.

PROFILE 2 is a modern design GEM program with an easy to use and thorough
interface which includes:

Choice of system screen fonts

Amodal dialogs in windows

Submenus

Full keyboard or mouse control

ST-Guide context-sensitive help using ST-Guide either as an accessory or
from disk

Any page, series of pages or whole report can be sent to the printer, a
disk file or the clipboard

Printer initialisation string

User-defined report label

Configuration saved to disk

GEM-List keyboard standard compliant

The report is most thorough, consisting of the following:

1 Hardware, TOS and Display
2 Memory
3 Drives
4 pun_info Structure
5 File System Limits and Capabilities
6 Floppy Disk Drive A Check
7 ROM Cartridge
8 Serial Devices - Current Settings
9 Miscellaneous Falcon030 Details
10 AES
11 VDI Drivers
12 Installed Fonts

2027. This news group is invited to a Secret online book ! All Ages Welcome!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-05 00:00:00 UTC
From: Robert Anderson <megacash4u@hotmail.com>
Message-ID: <5plv12$im1@news1.mnsinc.com>
Source record: 16462

You are about to learn how ordinary people can simply and easily achieve the once thought un-achievable. These Secrets will work for anyone. Simply apply them. This online book is one to study. Write any ideas or notes down. Read this one Secret at a time. Taking notes as ideas cross through your mind. Do not skip any Secrets. I have arranged the Secrets to increase your readiness for the coming Information. Each Secret builds on the other for maximum results. I wrote this online book for you in a way that simplifies understanding. This should make the secrets easier to apply. Enjoy!

2028. Autoswitch Overscan

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-05 00:00:00 UTC
From: DCroker@mettav.demon.co.REMOVE.TO.REPLY.uk
Message-ID: <2845_DCroker@mettav.demon.co.REMOVE.TO.REPLY.uk>
Source record: 16463

Anyone running AutoSwitch OverScan with MagiC - the overscan operates during the boot phase as it should, but subsequent attempts to use either the hot keys or the automatic resolution switch don't function, perhaps due to the loss of the extra XBIOS commands?

OverScan's home page appears to be down, and I don't have an email address so any thoughts will be welcome please.

Speak to 'ya later!

There are new versions of WP2 and TWP adapted to MagiC which does not permit jokers (* or ?) to be entered in the fileselector.

WP39.TOS and TWP30.TOS are packages to convert WordPlus and ThatsWrite docs to WordPerfect format and back.

2034. HELP - MIDI port programming

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-06 00:00:00 UTC
From: John Richardson <johnr@thedruid.demon.co.uk>
Message-ID: <ZMIlhBA$6uvzEwuD@thedruid.demon.co.uk>
Source record: 16469

```
Dave@moocow.u-net.com:
> Is this correct? and how do I get around this problem? I am using GFA
> Basic and compiling it for speed. Both of which produce the same
> results.

I'm no whizz with BASIC but I maybe able to help you. The MIDI port on the ST
is read by a 6850 chip it has two accessible registers, these are the status
register and the data register at memory addresses $fffffc04 and $fffffc06
respectively. The status register is made up as follows:

bit description
7 IRQ (interrupt request)
6 Parity error (I can explain parity if you wish,
but basically it means the data is corrupt)
5 Overrun error (data lost)
4 Frame error
3 Not used
2 Not used
1 Buffer empty (ready to transmit)
0 Buffer full (ready to recieve)

The IRQ bit is set when a data packet is ready to be recieved. Here is an
assembly language listing of how to read in data, registers a0 and d0 should
contain the address of your buffer and the number of bytes to read
respectively,.

midi_read_byte:
move.l #$fffffc04,a1 ; store address of status and data
move.l #$fffffc06,a2 ; registers
move.b (a1),d1 ; put contents of SR into d1
btst #0,d1 ; is data available?
beq .return ; nope, return
move.b (a2),(a0)+ ; yep store it.
.return
rts

midi_read_data:
bsr midi_read_byte

; error checking code goes here

move.w #150,d2 ; wait at least 1024 clock cycles at 8Mhz
.lp1 ; this will have to be adjusted for
dbra d2,.lp1 ; faster processors

dbra d0,midi_read_data
rts
```

You should be able to translate this into GFA using the relevent peeks and pokes. I've just made these routines now so I can't guarantee they will work. (Although they should.)

Thinking about it the wait loop would be better if replaced by a loop that waits for the IRQ bit of the SR to be set.

```
move.w #$fffffc04,a1
.lp1:
move.b (a1),d2 ; put SR in d2
btst #7,d2 ; is IRQ set?
beq .lp1 ; nope, loop.
```

Infact I would recommend this method.

Jr,

2035. sell/your/photos$$$$$

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-06 00:00:00 UTC
From: dre32d@msn.com
Message-ID: <5pocs6$47k$715@roadrunner.miracle.net>
Source record: 16470

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession, are in desperate need of fresh material, and are more than willing to review photos submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative themes.
At Photo Phoenix International, we delight in and value the work of people who view photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE, ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY, ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY, HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES, RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes, your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence, the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send entire portfolio unless we ask for it.
SEND TO: Photo Phoenix International

One-Number service puts you in control of your calls while ensuring that your calls, messages and faxes reach you regardless of your location. One-Number service does this by linking your existing telephones, cell phones, pagers, and fax machines through a single telephone number.

YOUR One-Number ACCOUNT COMES STANDARD WITH THESE FEATURES
- Consolidates your phone, fax, voice-mail and paging services
- Works with your existing products and services, no need to change
- Easily lets you designate yourself as available or unavailable
- Rings you at up to three numbers simultaneously
- Never-busy number accepts multiple incoming calls and faxes
- Call Screening (by name) lets you know who is calling
- Call Waiting lets you know somebody else is calling
- Call Move lets you easily transfer calls among different phones
- Call Conferencing allows conferences with other parties
- Fax Notification on your pager for incoming fax messages
- Redirect calls to Personal Operator (live person) if desired
- AND MUCH MORE

Virtual Office Communications Company is not a phone company, a long distance carrier, nor do we sell telephone equipment, cellular phones, cellular service, pager or pager service.
Instead, we offer service to integrate your existing products, adding value to what you already have by letting your phones, pagers, fax machines and voice-mail systems work together seamlessly.

To learn more please visit our web site at: http://www.mynumber.com

Please do not reply by e-mail as we are not set up to respond to e-mail requests.

>
>1) Can a run-of-the-mill EIDE harddrive which are so cheap nowadays be
>connected to the internal IDE interface

With EIDE i'm not sure, i don't have eide devices.
Also you can take any of the following devices.
All are 2.5" devices

Hitachi DK222A-54 540 MB 2.5"
Hitachi DK212A-81 810 MB 2.5"
Hitachi DK212A-10 1.0 GB 2.5"
Areal MD2085 80 MB
Fujitsu M2637T 240 MB
Conner CFN250A 250 MB
Conner CP2064 64 MB 2.5"
Quantum Daytona 500 MB
Seagate ST9077A 2.5"
Quantum Europa 1.08 GB 2.5"
Toshiba MK1002MAV 1.08 GB 2.5"

Sure, it's only a smal list of devices how works well with any f030

> in some way? Provided I have the drive in an external case with
>its own power supply, would it simply be a matter
> of running a new ribbon cable out of the Atari case? Are there any
>IDE communications problems with this setup?
> How about Atari HD driver issues?

If you like to connect a 3.5" drive use a extra psu!
Don't use a ide cable longer as the double lenght of the original cable.

Falcon ide don't have any port driver!

Use HDDriver 6.-> for nice and fast access.

Regards, Robert

You need to pan the channels where you want them using one of the mixer
maps.

2048. How to network a Falcon & Win 95?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-08 00:00:00 UTC
From: bjr@Edison.EbiCom.Net
Message-ID: <5psgdp$fka@einstein.ebicom.net>
Source record: 16483

Aloha,
What is the best way to network a Falcon and a Windows 95 machine?
I'd like to go with some kind of TCPIP connection that would allow me to
connect to my ISP via modem with the PC, and then make queries and such
over the internet with the Falcon (I.E. run web browsers and such
simultainiously on both machines from a single modem connection). It
would also be nice if anyone knows of software that would
allow drive sharing between the two machines over the network.
Finally, is it possible to hook both machines to the same SCSI
chain (obviously provided each host is set to different IDs). Whould
this reek major havoc? And if this would work, what is a good
hard disk format and partitioning scheme that is easily read by both
machines?

2049. connecting a TT8 to a NT Network ? - using a Switchbox for monitor,keyboard and mouse

hello experts,

i'm planing to to connect an atari tt8 to an existing nt/w95 -
ethernet netwok - here my questions :

1. what harware do i need for the tt8 (networking card ?) and where
can i get such a thing .

2. what software do i need to use at least the harddisks, cd-roms,
worms, printers, modems and isdn-cards on the pc based part of the
network - via tcp/ip.

3. as i use a swichboard to use just 1 keyboard,1 mouse and 1monitor
on up to 6 different pc's at the sysops room - can there be a solution
for the tt either - means using a com port mouse and a standard pc
keyboard on the tt - monitor should work as far as i remember my atary
days ...

Options:
* a 'transfer' program, such as Ghostlink, or PARCP (sp?)
* a full TCP/IP link. Windows95 DUN (dial-up-networking) only uses PPP,
AFAIK, so MiNTnet is probably the only option.

I very nearly had a MiNTnet setup working - a few minor setup problems
which were mainly due to being unable to use a standard MiNTnet
installation (I was working on a floppy based system). I also encountered
a bug in Win95-DUN which crashed my machine every time I attempted to
connect.

> I'd like to go with some kind of TCPIP connection that would allow me to

Ah. I am told that MiNTnet will not be able to share a modem with
another machine until it supports another feature (IP shadowing, or
something?)

> would also be nice if anyone knows of software that would
> allow drive sharing between the two machines over the network.

An NFS client/server is available for MiNT-net. All you have to do is
find a freeware NFS for Win95.

Brian Roland <bjr@Edison.EbiCom.Net> a crit dans l'article
<5psgdp$fka@einstein.ebicom.net>...
> What is the best way to network a Falcon and a Windows 95
machine?
The best is to use network system under Mint. It's hard to
configure
but it's works.
The Falcon will be the server (The Win95 machine aren't
servers, so you
won't get any file from the PC to the Falcon). You can make
the Falcon
a PC-NSF server, a web server, a mail server, ... But it is
very slow too.
> Finally, is it possible to hook both machines to the same
SCSI
> chain (obviously provided each host is set to different
IDs). Whould

> machines?
You can connect 2 machines on a single SCSI bus.
You must have only 2 terminators (there is one into the
Falcon).
And the 2 machines must have differents SCSI numbers. The
default it is 7,
but with HDDriver you can change it.

2052. HP 6L under NVDI (driver)?

Newsgroup: comp.sys.atari.st.tech

NVDI 4.11 comes with a number of HP drivers, but they only go up to the HP 4L.

Is a driver for the HP 6L printer available for NVDI, or will one of the existing drivers be sufficient?

Any help would be much appreciated.

The HP4 driver will do just fine as it accesses both 300 and 600 dpi.

Yes, this is possible if on the Atari you run a driver supporting initiator identification (CBHD, HuSHI, HDDRIVER). And, of course, if you want to share partitions these partitions have to be DOS compatible. For DOS compatible partitions > 32 MByte to be recognized by the Atari HDDRIVER (and for most partition types also CBHD) and Big-DOS or MagiC 5 are required. Note that one computer doesn't recognize if the other changes data on the shared partition. This might result in damage if you write data on the same partition with both computers without flushing the caches of your hard disk drivers first.

What's new in the HP 6L? I have the HP 5L and the 4L driver works just
fine. All you have to do is to change some lines to make it support the
higher resolution (600dpi).

What does the 6L look like btw? Is it in the same style as the 5L, or is
it more like the old 4L?

Take Care,
Daniel

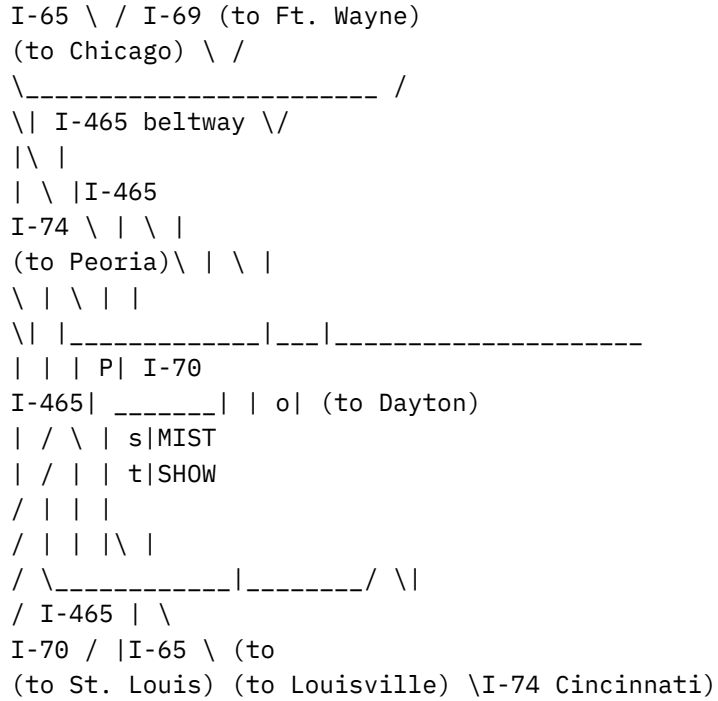
WHAT: 9th annual (final) MIST Atari Show.

WHERE: Indianapolis, Indiana, USA.

WHEN: Saturday, July 26. 10 am to 3 pm, Indiana time. (Same as
Central Daylight time.)

SITE: Post Road Community Center, 1313 South Post Road.

DIRECTIONS: Post Road is located between exit 90 of I-70 and
exit 96 of I-74, outside the I-465 beltway, on the southeastern side
of the Indianapolis area. See map below.



ORGANIZERS: Charlie Sears (317-535-4829), csears at doe dot state
dot in dot us. Jeff Hammer (317-244-8492), jghammer at indyunix dot
iupui dot edu. Stu Huffman (812-988-7558), shuffman at doe dot state
dot in dot us. ADMISSION: $1.

>>> ANSWERS TO FREQUENTLY ASKED QUESTIONS <<<

Q: Who is this show for?
A: All Atarians.

Q: Does that include me? I have a ______ [FILL IN NAME] Atari
[CHOOSE ONE] computer / game machine / other product.

A: Yes.

Q: Can other people attend? For example, people interested in buying state-of-the-art or antiquarian computer products from the various vendors represented at the show?
A: Yes.

Q: Do I have to be an Atarian to attend the show?
A: No. Your dollar is as good as any other dollar.

Q: Are there other things to do in exciting Indianapolis while I'm there for the MIST show?
A: You'd be surprised.

Q: Why am I seeing this message more than once?
A: Because there's more than one Atari newsgroup.

Q: Why is this message posted on all the Atari newsgroups?
A: Because it's an Atari show.

Q: But which newsgroup is it really appropriate for?
A: All of them.

Q: So why isn't it crossposted to all of them simultaneously?
A: In that case many people wouldn't see this message at all. Filters commonly weed out messages with multiple crosspostings.

Q: Why is this the last show?
A: If everybody reading this shows up, maybe it won't be.

(This message posted independently by Erasmus at the eskimo hut. Send flames to Erasmus, not to the show organizers.)

Well Folks,

After all the great input from everyone (thanks a bunch!), I decided to buy a used 2.5"
from a computer store in the area call 'Computer Renaissance' (very cool place). Anyhow,
I was able to find an older IBM 270MB IDE drive for $80 which is just fantastic. I didn't
realize how incredibly SLOW the 80MB Connor I had was until I got this thing. Quite
a chipper little bugger.

Popped it in, formatted and paritioned w/HDX and off I went. Linux/m68k 2.0.29 now runs
quite happily on my Falcon. I could do with more memory, though. What's the current
situation in the marketplace for upgrading a Falcon w/4MB? 8MB would be fine.....
Any suggestions?

I can't get video synch using this software unfortunately, I've tried it
before. I've got a Lacescan mod in my 2nd ST and have found that Calamus
1.09N isn't really usable with the driver software installed (toolbox icons
are trashed), with or without the large screen active.

Speak to 'ya later!

Hehe, the Conner is pretty slow:).
For ST Ram, your stuck with 4 or 14mb. Their are several cards available to do the trick. In the States, try either Systems for Tomorrow for a Ram Gizzmo (uses 4-30pin 4mb simms) or Wizztronics Falcon memory card (it can accept either a 4mb or 16mb 72 pin simm).
Both are on the net. www.wizztronics.com or www.systemsfortomorrow.com

From: rcain@zetnet.co.uk
Message-ID: <5q350p$8a2$3@roch.zetnet.co.uk>
Source record: 16504

I have just acquired a TT (which has its own internal SCSI HD). I have attached my existing SCSI device stack via the ACSI. This all works OK.

What I would like to do is have the TT boot from the ACSI connected HD. I have tried just about everything!! The most obvious approach was to de-install the driver from boot partiton of the HD on the SCSI port and ensure that there was an enabled driver on the first partiton of the ACSI route. The TT did not find the boot partition on ACSI :(

FWIW the SCSI connected HD had HDDRIVER installed. I don't think this has anything to do with it though. It is a question of what the TT looks for on power-on and whether it is possible to tell it to look for boot sectors on ACSI connected devices.

Help, please?

I once heard that it was possible to increase the ram on an STfm by soldering new chips right on top of the old chips (piggy back style). I've only heard of this once and was wondering if it would work. Has anybody ever tried this before or know if it is possible??

What is the SCSI id of the ACSI hard drive? Make sure it's 0,0 so the
TT will see it. If you have it 0,1 the TT may not be seeing it at all.

The 6L looks almost exactly like the 5L. It has a small footprint but I must say the Brother 660/760 units are nicer because they have a straight paper path. Try printing an envelope from a 5L or 6L and watch it curl up with the heat and curved paper path. I like the Brother although both printers seem to have gone to proprietary RAM for some reason.

2077. Floppyshop's New Email Address & Web Page

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-11 00:00:00 UTC
From: Steve Delaney <sdelaney@zetnet.co.uk>
Message-ID: <sdelaney-1107970752320001@man-084.dialup.zetnet.co.uk>
Source record: 16512

Hi All,
Just a quick note to inform you that I have changed my ISP to
Zetnet with
immediate effect. The result is that the old Wintermute account will
be closing
down in a few weeks and any messages to my old address will bounce
back. Please
change my email address in your address books or yellow pages
immediately to
avoid confusion. Also, could those of you who maintain lists of email
addresses
for Atari users in your disk mags or on-line publications pleaseensure
that you
ammend your lists accordingly, thanks. The new address is:-

sdelaney@zetnet.co.uk

The main Floppyshop Web pages remain unchanged at the address in my
signature. I
have now added a new WWW page at Zetnet. It contains the full ST and
Falcon
catalogues as well as demo versions of most of our commercial
releases. Although
many of these were available at the old Wintermute address, the method
of accessing
them was cumbersome and unhelpful. Everything is now presented in html
format and
downloads require no more than a click onto the appropriate link. The
address is
as follows:-

http://www.users.zetnet.co.uk/sdelaney/downloads.html

As far as I know, everything on the site works fine. If you encounter
any
problems, please email me (sdelaney@zetnet.co.uk) with details. A
mention
for this new WWW page would be appreciated from those of you who
publish
magazines/disk mags/on-line publications.

Thank you for taking the time to read this message.

Regards
Steve Delaney

Steve Delaney @ Floppyshop sdelaney@zetnet.co.uk

I know somebody who did this; it was not very reliable, however.

Maybe it depends on your soldering skills :)

The instructions are on umich, in the Misc directory.

>anybody ever tried this before or know if it is possible??

Quite correct. If you have the courage to do this you are able to
share power/data/address lines already printed on the board. You do,
however, have to lift the CAS legs and connect to CAS1 for which you will
find an outlet on the PCB. The chips you add must be of the same type
as those there already. When you do this you are effectively
connecting Bank 2 of the RAM.

What store do you have in the STFM ATM? I once had 512Kb in my STM and
did a rather more complicated mod. to replace the chips with 1Mbit
devices which gave me 2Mb in Bank 1. There is a doc. about how to do
this by Barry Orlando.

Your other options:
A supplementary board (i.e. AST) which does the same thing a bit more
cleanly.
A Marpet or Frontier RAM expansion board which is fitted using plugs
and takes common SIMMs. You can get up to 4Mb this way.

Ah .... you have hit the nail, Keith. It is 0,1 and, NO, the TT
doesn't see it. It is buried inside a PC box together with other kit
so not easy to get at the jumpers. If I was going to take the time to
do this I would arrange to connect it all to the SCSI port, anyway.

Uwe has pointed out that recent HDDriver versions allow you to specify
the scan sequence so that I could fix that the ACSI drive is seen
first. Just my luck, the HDDr version in the TT is 4.5 which does not
allow that!!

My "regular" driver is CBHD (because I use GEMAR v3). It's not obvious
that this will allow me to change tha scan sequence.

This was supposed to be a quick fix to allow me to locate the ACSI
partitions where they expected to be. With the time it has taken me to
suss all this out it would have been quicker to dig out the ACSI-box
and re-engineer it for SCSI connection :-) That's life, eh.

Yes, this is what I want!
I would like the setup to have the 'look & feel' of Ghostlink, without
tying up the PC side. Some form of NFS using windows 'built in direct
connection' & a MiNTnet'd Atari would good.

>
> An NFS client/server is available for MiNT-net. All you have to do is

I found two atari NFS's:-

nfs-050.tgz (available on umich).

fspclient.tgz (gives bad link, not found).

Has anybody used either one ?

Is there a freeware PC NFS ?

Apparently it has something to do with SCSI ID numbers - the lowest
one wins (or something). Change them, and see what happens...

Do you have a hard-disk? and how much RAM? I had difficulty fitting it
onto a floppy - but you only need a minimum install on the floppy as
once the link is established it could boot an AES and setup or whatever
from the PC's hard-disk.

> > Options:
> > * a 'transfer' program, such as Ghostlink, or PARCP (sp?)

> I use Ghostlink, it works well, but only in DOS mode, so the PC is not

I'm sure I managed to get it to work by simply running it from a DOS
window?

> > * a full TCP/IP link. Windows95 DUN (dial-up-networking) only uses PPP,
> > AFAIK, so MiNTnet is probably the only option.

> Anybody know how/what you need ?

Right, here some of what you need:
MiNT
MiNTnet 1.0
pppd
nfsd/nfs/mount
syslogd (can be found in the MINTOS package)
rpc and portmap (from the Sun RPC package)
There may be more that I have forgotten.

All of these can be found at
ftp://pascal.math.fu-berlin.de/pub/atari/MiNT/
or other Atari sites. (fu-berlin seems to be the most up to date
for mint software).

If you haven't configured a unix system before then you might
want to get a pre-packaged system (such as KEMD or PPP-kit).

At the PC end, MicroSoft supply most of the software you need -
although as previously mentioned an NFS client is not included
(but FTP, telnet, Main/News and WWW are - as well as the trivial apps
like ping, route etc. - these can be found in \windows)

> Is this a Telnet type setup, or can you see drives, etc?

The MiNT NFS client (nfs.xfs) creates u:/nfs/ which contains all mounted
remote directories - you can of course link this directory to another
drive letter (or anywhere else) if you want.

You can of course just use telnet and ftp if you dont have a PC
NFS client.

> > I very nearly had a MiNTnet setup working - a few minor setup problems
>
> Can we have details please ?

The bug? dunno what caused it - I'm not having any problems now with
my dial-up ISP.

On the Atari you will need to set up the u: drive with all the
directories /etc /bin and so on. /etc is for config files, and you
will have to edit these apropriately. There are too many files to
describe all the changes here - I guess I could upload my (not fully
configured) system to my WWW pages if someone wants them?

At the PC end you will need to create a 'direct cable connection'
using the TCP/IP protocol. I the 'network' options in the control
panel, set all of the options to match the values set in the Atari
/etc - I dont know, but you may have to edit \windows\hosts and the
other files that are simular to the Atari \etc files.

I've had to reset my win-95 system to get this dial-up system to work,
so I'm afraid I have given up for now trying to get it to work...

> > > would also be nice if anyone knows of software that would

Yea, and also the ability to run programs from the PC side. And transfer
the other way as well... (use Atari drives on the PC)

> Some form of NFS using windows 'built in direct
> connection' & a MiNTnet'd Atari would good.

Yes, it would - although it may be slow...

> > An NFS client/server is available for MiNT-net. All you have to do is

>
> I found two atari NFS's:-

> nfs-050.tgz (available on umich).
> fspclient.tgz (gives bad link, not found).

> Has anybody used either one ?

I was using the first - I successfully got it to mount my Falcons
drives on itself, so the setup was definately working - but as the

link itself didn't work I couldn't test it with a remote machine.

> Is there a freeware PC NFS ?

I did a search on the net and couldn't find one. What I did find was a page looking for beta-testers for one, but you had to 'register' before you could get the binary - and the date wasnt too recent... Someone should know though - maybe ask on a PC newsgroup? [nfs is a unix standard, and is available on most platforms, so there should be one...]

If you are successful, post here. :)

Anthony

The reason for this messing about with s/w is that I wanted a quick
fix without having to get inside my "SCSI-box" and fiddle with the
h/w! I think it may have been quicker to do this :)

Uwe points out that, if I had a more recent version of HDDriver I
could configure it to change the scan sequence. Just what I wanted -
unfortunately HDDr is at v4.5.

Someone else said that if my ACSI-connected HD had been ID 0 (rather
than 1) I would have had more luck in picking it up as the boot
device.

C'est la vie!

I was under the impression that GEMAR >=v3 required the special SCSI
s/w interfaces provided by CBHD (GEMAR <v3 did not require these).

Claus and Stefen provide a module SCSIDRV.PRG with CBHD which adds
these interfaces. Perhaps (and I haven't tried it!) SCSIDRV.PRG can be
run on top of HDDriver to provide these i/fs. Is this what you do,
Rich?

I've Added more stock to my Atari catalogs. So check it out.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

It's not that big a deal to open the PC box and change the jumper to set up the drive to 0,0. What kind of drive is it? I can get you the jumper settings for the drive and it shouldn't take you more than 15 minutes to do this.

Keith

r> for boot sectors on ACSI connected devices.

Have you tried to reconfigure the order in which drives are read using
HDDriver? I haven't tried it yet because I haven't needed to connect an
external drive, but with the MSTe (I know it's not the same) I just loaded
the SYS file into HDDRUTIL, went to "Device Configuration" and dragged the
ACSI 0 device in front of SCSI 0, then in "Partition Configuration" I set
ACSI 0 to partition C and SCSI 0 to partition G.

Does that work with the TT? I couldn't say whether the manner in which it
powers up has anything to do with it, in the way you describe...

There is no direct connection but GEMAR can use the SCSIDRV generic SCSI
interface included in GEMAR. HDDRIVER 7 will also support this
interface. (HDDRIVER 7 will be available later this month.)

It's an IBM DSAS - I have all the specs.

You haven't seen my computer desk, Keith!! What with both STM and TT
around with their respective monitors and other junk there's no room
to do very much. I have gone in for "vertical integration" which means
that things are balanced on top of other things (recursively).

Yes, I KNOW the right way to do this is to re-jig the stuff in the PC
box to connect to the TT SCSI. I was just trying to make the most out
of the wonderful Atari compatibility enshrined in the common DMA port.

Yup, nice one, Harry. This is what Uwe suggested.

The b****r of it is that the HDDriver which came with the TT is only
at v4.5 and this version does not allow dragging around of devices in
the scan order.

Oh well! You learn something new every dat :)

I am selling the following, preferably together, preferably in the California Bay Area:

1 Atari TT030 with 2meg ST ram, 4meg TT ram, built-in 105meg Quantum, TOS 3.06, 1.44meg floppy. TT ram on ATARI ram board allowing upgrade to 16meg. Excellent condition, comes with original box and software. Also includes a new mouse, a used trackball, joystick and a good condition keyboard (Mega ST style, the TT keyboard had some bad keys and went with my old Mega to a friend)

1 NOVA Video card. ET4000 chip with 1meg video memory. TT version. Excellent condition, in box with software and manual (unfortunately in german - will include set-directions from dealer in english - comes pre-installed on TT)

1. ICD FaST HD box. ADSCSI emulation built-in. For TT or any ST model. Has brackets inside to 2 drives, currently comes with one 105meg Quatum HD. Excellent condition, includes original box and software/docs.

Also have a 14,400 bd USR modem in box in excellent condition. Lots of software, including pagestream, Magic 4, NVDI 4, Atariworks, Diamond Edge, Diamond Back, XBoot, Imagecopy 3.5, Truepaint, etc.

Best offer gets the lot, please contact me soon!

2104. ST/SMPTEtrk.prg w/MidiPlexer/HD ~ PROBLEM!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-13 00:00:00 UTC
From: gkeys409@zymondo.com
Message-ID: <5qa942$sj6@ux2.accesscom.net>
Source record: 16539

Dear Fellow ST People, specially you MIDI brothers and sisters,

I have a 4Mb ST with the HybridArts SMPTEtrk gold and MidiPlexer and a 85Mb SCSI HD

For some reason (this is the part I need help on) the SMPTEtrk.prg won't recognize the MidiPlexer with the HD running. Only if I run.prg from
floppy with the HD off will it recognize the MPlxr.

I can boot with the HD (MPlxr ON ~ because I'm running thru the MPlxr) so the ST recognizes the HD, then unplug or turn off the HD (I know that
ain't good to do) run SMPTEtrk.prg from the floppy... get it to recognize the MPlxr, then turn the HD on or plug it back in to the back of the MPlxr
and everything is fine... Ofcourse I do know that is less than a poor solution.

PLEASE! Any suggestions would be greatly appriciated. PLEASE HELP... I know there are better seq'ncr our there but my SMPTEtrk still works
find and I know how to use it well.

Source record: 16541

Does anyone know how to turn the auto-response off in AtarIRC? For example,
when someone issues a SOUND command, AtarIRC will automatically /msg them
telling them that my sound is turned off.
The only way that I have been able to turn it off is to turn off
my incoming ctcp functions, which naturally turns everything else off.

Thanks,
Terry

2107. $$$$$ NEW SYSTEM, BETTER THAN "ADD ME TO YOUR MAILING LIST" $$$$$

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-13 00:00:00 UTC
From: a20@a.a
Message-ID: <33c92269.0@news.unibe.ch>
Source record: 16542

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to

work. This
system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

$39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES
matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this
as a business. If you treat it like a hobby that is how it will treat you. You could even organize small
meetings with your people and their prospects and work with your leaders.
Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it
working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to
send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help
you in your financial need, you may pay me back if and when you can" to the following needy people:

2108. $$$$$ LOAN BUSINESS, EASY MONTHLY INCOME, NO BRAINER $$$$$$$

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-13 00:00:00 UTC
From: a15@a.a
Message-ID: <33c92281.0@news.unibe.ch>
Source record: 16543

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to

work. This
system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

$39214 ***

Yearly income: $39214 x 12 months = $470,568

2109. Can I Use Falcon's SCC(LAN) port for Null connection?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-14 00:00:00 UTC
From: bjr@Edison.EbiCom.Net
Message-ID: <5qcp19$2pn@einstein.ebicom.net>
Source record: 16397

Aloha,
I'd like to use the SCC port on my Falcon to network with a
Win95 box. On my Win95 box, I have a spare modem port, and a USB port.
On my Falcon, the only port I don't use regularly is the SCC port, so
I'd like to use this if possible, to build a "null modem" connection to
the PC.
Anyone have any suggestions? Will this work at all? I hope
to use mint-net to establish a TCP/IP connection across the machines, and
possibly a NFS drive sharing connection as well. Before I can even begin,
I need to know what cable to build and how to do it.

Please reply by email if possible. I've noticed that my news-server is
missing a lot of posts! How? Because when I log on thru a friend's
computer who uses a different "university based" ISP, he gets answers to
all the questions I post but never get answers for :(...0

Thanks,
Brian

Roger Cain (rcain@zetnet.co.uk) wrote:
: I have just acquired a TT (which has its own internal SCSI HD). I have
: attached my existing SCSI device stack via the ACSI. This all works
: OK.

: What I would like to do is have the TT boot from the ACSI connected
: HD. I have tried just about everything!! The most obvious approach was
: to de-install the driver from boot partiton of the HD on the SCSI port and
: ensure that there was an enabled driver on the first partiton of the ACSI
: route. The TT did not find the boot partition on ACSI :(
:
: FWIW the SCSI connected HD had HDDRIVER installed. I don't think this
: has anything to do with it though. It is a question of what the TT
: looks for on power-on and whether it is possible to tell it to look
: for boot sectors on ACSI connected devices.

I remember running into a problem like this when I first got my TT. As
far as I can tell, the TT looks first at the SCSI subsystem for a
drive, and if it doesn't find any, continues on to the ASCI subsystem. If
it finds a drive on the SCSI subsystem, it tries to boot from it. If it
can't, it doesn't continue looking for other drives. You may be able to
start the hard disk driver from floppy, telling it that the AUTO folder
is on whatever drive letter your first ASCI partition gets. Or you could
just disconnect the drive connected to the SCSI subsystem.

Yes, Uwe confirms that it uses this order.

If
>it finds a drive on the SCSI subsystem, it tries to boot from it. If it
>can't, it doesn't continue looking for other drives.

Mmm ... one reply I had implied that it might have booted from the
ACSI HD IF it had ID 0. Unfortunately it is at 1 and is buried very
deep!

>Or you could
>just disconnect the drive connected to the SCSI subsystem.

Ah,but this would mean excavating the TT :(

Uwe made the very useful suggestion that recent versions of HDDriver
allow you to change the scan sequence. If my HDDriver had been better
than 4.5 I could have told the driver to scan the ACSI set first which
would have been just what I wanted.

2114. HD Driver V6.00

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-14 00:00:00 UTC
From: 180deg@warp9.mr.scott
Message-ID: <5qcloaair1@ash.ridgecrest.ca.us>
Source record: 16545

Hi,

I was setting up a second EZ135 on my Falcon. I noticed when using
HD Driver to format the disk, under SCSI options, the new drives menu
"send unit attention" was not grayed out as it has been on my
other drive. Did the manufacture of these drives change to support
bus arbitration?

Will there be any U.S dealers for V7 of HD Driver? Toad has pretty much
given up the goat over here. System solutions is not a viable option for
ordering either in the States. I guess that Uwe (your probably reading this:)
must be under license with System Solutions as the lone distrubitor outside
of Germany as most dealers seem to get their supply through them. It a shame
as by the time V7 arrives on my hard disk, V10 will be out:(. Same with MagiC
Mac. I know a much newer version than what I have is available in Germany, and
I ran the demo without problem. Ash's opinion however was I would not want the
German version.....I saw little difference between the two. Computer Direct
is an excellent source for Euro software, but it's kind of nice to be able to
order UPS second day and get the goodies before the weekend:).
I have kind of enjoyed thumbing through my German dictionarys, and now have a
good "working" knowledge of several "German" only apps. SCSI Tool wasn't all
that hard to figure out. We really need a better solution over here than just
waiting. Hell with the language barrier. On a TOS machine, it is hardly noticable.

From: scotty@pagesz.net
Message-ID: <5qehuf$3ht$3@pinta.pagesz.net>
Source record: 16402

Hi Folks,

I finally got around to trying a SCSI CD-ROM drive on my Falcon. I tried several drivers, and finally got the Atari .XFS driver for MiNT 1.4 and later to work.

I've tried all of the CD-ROM Players I could find on the Umich archive and on the HENSA archives, and I couldn't find any that would work. Most of them want MetaDos, but even the ones that don't bomb the moment I try them.

Here's a short list of ones that didn't work:

cdlistn2.lzh
cdplr13c.lzh
cdrom07.zip
cdplay.zoo

There were others but I've already deleted them...

Does anyone know of a Falcon CD-ROM player known to work properly?

Thanks for any help!

Scott Chilcote / scottyATpagesz.net

Unit attentions has to do nothing at all with bus arbitration. Simply
forget the unit attention settings. They are of no importance except for
those running very old versions of TOS.

> Will there be any U.S dealers for V7 of HD Driver? Toad has pretty

In the UK HDDRIVER 7 will be available from System Solutions. In the US
and Canada you can get it from Computer Direct. I intend to release
HDDRIVER 7 by the end of this month.

Depending on the circumstances there might even be another solution but
this one, too, depends on the HDDRIVER version you're running. With
"Partition Assignment" you can tell HDDRIVER (using HDDRUTIL, of course)
how partition IDs are to be assigned to drive IDs. You can configure,
for example, that ACSI device 0 gets drive N: as first partition whereas
SCSI device 0 gets E: as first partition etc. This way you can fine tune
the correlation betwenn partition IDs and drive IDs.

2120. URL of Samaritans wanted - my HD is fried

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-15 00:00:00 UTC
From: odonnllb@vax1.tcd.ie
Message-ID: <1997Jul15.104824@vax1.tcd.ie>
Source record: 16405

Last week I bought a friend's Atari kit; neither of us wanted to see it go into storage, and he hadn't any room for it. It included (doomladen organ chords) an ICD link and Data Pulse HD, along with an instruction book for same, which was excellent - chatty, but not boringly informative about things you might need to know. I saw that I could add the ICD link to the back of my own (modified) Atari HD. I thought (fool!) that this would be a nice idea.

A few minutes gruntwork and cable pushing later, I switched everything on, and had a system which required a floppy to boot up. At this point I should have realised I had problems. Instead (twice fool!) I reread the instructions, looking for coded messages, microdots, real technical data and similar non-existant and superfluous information, and then plunged on.

Switching on my own HD showed it had survived the experience, so (third time's the charm) I switched on the Data Pulse and tried the Host program to see if this gave me a clue. It didn't; what I did get was a little bee in the middle of the screen that wouldn't move or go away, and a message on the top right: 'Msense $f8'.

I switched off, and my HD hasn't spoken to me since. The other b****** lives. The situation is desperate, but not serious. I've only lost some source and a lot of graphics for a game that nobody is interested in.

But it's boring rewriting source (I know; I've been here before), and graphics aren't my favourite at the best of times. And the information has to be still on the disk somewhere.

So, does anybody have any ideas? Or do I break out the Neochrome again?

TIA

This is another nice feature, Uwe. I can see it in the v6 demo I have
but it is not present in the v4.5 registered version, Schade!

I am really going to have to decide whether to continue with CBHD or
whether to sign up for HDD v7 when it arrives. As you have gathered I
am keen on GEMAR >=v3 as it is the only tape archiver I can get to
stream properly; Diamond Back just does suck-blow!

With HDDv7 I could have the best of both worlds.

As there was no quick solution to my previous problem of booting the TT
with my old partitions in place I have taken the arduous step of
moving Mbs of files around into their expected places. I am still
getting some "wrong paths" but will have to correct these as they
become apparent.

I'm confused.

I have been running a Zoltrix 288 (VFC) modem from the STM serial port (modified) at 38k4 for a long time.

I have been fortunate enough to get a TT and thought that one of the big advantages would be that I could run the modem at a higher DTE. I would like to get to 57k6 at least so that the DTE could keep up with 28k8 DCE while compressing.

Gasp! I stuck the HSMODEM7 kit on the TT and find that intelligent comms programs recognise that high DTE is available on Modem 2 and Serial 2. However, I do not appear to be able to drive the modem above the rate I used to use, 38k4.

The symptoms are failure to respond to AT or ATZ commands sent from Connect.

Surely something is wrong :-(Anyone know what it might be, please?

The only dignosis I can make is that the modem circuitry is too slow to respond to rates >38k4. The leaflet which came with the modem says "115,200 bps Throughput" so I hesitate to believe that this is the case.

Help!? The cat is getting a very bad kicking here.

Hi Spencer,

I had some problems with V6.0 to begin with. I broke down and followed everybodys suggustion in the A/B mailing list and just made a boot disk. Now even V6.0 works fine without error on a 2gb IDE drive. When I get the Mighty Sonic Falcon put back together, i'll also try the option on that there too as V6 was usless on that machine, but now I tend to think that it was the IDE drive causing the problem (ahemm V7 fix?):). If Uwe reads this, which version is the "out of memory" bug fixed in concerning partioning large IDE drives?

Because Modem 2 offers unusual speeds above 38400. Modems don`t
support those speeds.
There are two possibilities:

a) Use Serial 2 and you can go up to 230000 bps without any modification.

b) Modify Modem 2 as being described by Harun Scheutzow in his HSModa
docs and then use it at speeds up to 115200 bps.

: Surely something is wrong :-(Anyone know what it might be, please?

Nope, this is normal behaviour. The speeds at Modem 2 are just a little
too weird for modems.

Bye,

Kerstin

Errk ... never seen this.

It will attempt to write details of a back-up into a folder called
LOGFILES which is supposed to exist in the folder where DB lives.
Perhaps you haven't got this folder?

Ah, yes. I had noticed that only Serial 1 and Serial 2 offered the
speeds to match the modem.

>There are two possibilities:
>
>a) Use Serial 2 and you can go up to 230000 bps without any modification.

Do you mean I don't even need HSMODEM, Kirstin? I've got so used to
using this with EVERYTHING!

>b) Modify Modem 2 as being described by Harun Scheutzow in his HSModa
> docs and then use it at speeds up to 115200 bps.

This is the clock frequency mod.? I think I will avoid this for a
while.

Suddenly, this morning, great joy!!! I don't know what I did but
Serial 2 started to work for me like a dream. I saved all the configs.
I could see so that it didn't disappear again. I think the setings
saved by MODEM.CPX may have had something to do with it. Also I was
getting myself confused by having more than one comms. program going
at the same time. I think they were fighting over a semaphore
somewhere.

>Nope, this is normal behaviour. The speeds at Modem 2 are just a little
>too weird for modems.

Mmmm ... what sort of serial devices use these speeds (76k8, 153k6),
printers perhaps?

Thanks for your explanation, Kirstin.

I've just added several BoxFulls of ST HardWare, Next I'm adding more SoftWare for the Atari 8 Bit. Check out my Catalogs for HardWare and Books as I have added more Items to the Catalogs.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a

special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.
--
Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

System Solutions have distributed 6.30 for several months as far as I
know. Concerning the release date of HDDRIVER 7 you have to ask System
Solutions themselves. My guess is that the new version will be available
without much delay. As I already indicated System Solution will get the
new version from me the same time the German version is released, i.e.
next week.

2145. HDDriver 7 ???

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-18 00:00:00 UTC
From: trax@cedep.com
Message-ID: <5qo0mnfbt1@wagner.videotron.net>
Source record: 16430

Great...I just received HD Driver 6 from System Solutions last week. Does version 7 support JAZ drives? (ie-Jaz drive copy protection). I bought it specifically for this reason...

I also just recived CAB 2.0 . And now CAB 2.5 with PPP is soon to be released...

System Solutions does ship quickly (1 week to North America, east coast). But FORGET about TOAD computers. After 7 MONTHS, I'm still waiting for them to ship me MagiC 5.

A VERY frustrated, yet still faithful Atari user (Am I a masochist or what?)

Stephen Angelini / trax@cedep.com

2146. July 26 Atari Show: Vendors & Details

INFORMATION ON THE JULY 26TH MIST SHOW

(recently circulated by co-organizer Jeffrey G. Hammer)

Here is a partial list of MIST FEST IX vendors/user groups attending:

Nashville Atari user Group
Emulators, Inc (Derek Mihocka)
FMH Games
LCACE
ACORN.
LAG
ICD
It's All Relative.
Systems for Tomorrow
SCAT

Remember, because of the state of the Atari market in the U.S., this
may very well be the last great Atari Show in the U.S.

Location for MIST IX is the Post Road Community Center in southeastern
Indianapolis, halfway between Interstate Highways 70 and 74.

The location is south of Washington Street (U.S. 40) at 1313 South Post
Road.

Entry tickets are $1. Show hours: 10 a.m. to 3 p.m.

For details: Crossroads/MIST BBS U.S. = 317-535-1643
or csears at doe dot state dot in dot us

Oh, sure. Wouldn't it be more appropriate, perhaps, to do it in
Sunnyvale? (hint hint)

Oh well.

2154. Problem with NOVA Card and Serial port

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-19 00:00:00 UTC
From: ddc@imaginet.fr
Message-ID: <5qqmrh$mia@belzebul.imaginet.fr>
Source record: 16439

Hello to all,

I have bought a few weeks ago a NOVA graphic card (on a MegaSTE). All was fine (except the battle to make NVDI work with it). Until I discovered with horror that most of my downloads were corrupted. I checked everything I thought of. Even on plain TOS, without plugging the monitor to the card, and not using the NOVA drivers, the problem still occurs. Putting the card out of the MegaSTE, with the same configuration, solves the problem at once.

It could be a conflict beetween HSMODEM and the VME bus. But, anyway, I am stuck with HSMODEM, because I am not going to connect at 14400. I did check with Modem 2 and Serial 2. I have tried to modify every SCC and DRVIN parameter I could think of.

If somebody has the same problem, or can think of any way to cure this, any help would be much appreciated.

Thanks in advance,

Didier BRIEL

Hello,

I have two floppy drives on my TT, one DD and the other is HD, until
now, I never had problems ...
Though the drives are continuing to Write, Copy, Delete they don't
accept to format anymore ...
I have tried under TOS desk, with Neodesk and even with Kobold ... the
only answer I receive is:
"Check your drive or insert a floppy" it don't even begin to format
the floppy ...

I have also remarked that the copy process has becomed very very slow
.. though it continues to work ...

What do you think about ? both drives react in the same way ... do I
need to change the floppy controller or what ?

Thank you for any answer ... but please don't answer here because I
have nomore access to the news servers this time ... our belgian
provider has a lot of problems since four days ...

Thanks

Jo

Hmmm ... I wonder. I don't have a NOva card but am getting a few
scrambled messages (STinG + Newsie 0.78) and 100% of the downloads I
have done are corrupted.

Ha! I have done the same. What HSMODEM are you using? I am on v7.

I have heard rumours that there have been troubles with anything above
v4. These are JUST rumours, though.

> If somebody has the same problem, or can think of any way to cure this,
>any help would be much appreciated.

Well, as you see, I can't blame Nova for my troubles but I get the
same symptoms as you.

What do you use to connect? I am on the latest STinG (1.04, I think).
I have settled on Modem 2 at 38k4 on the TT ATM after much
experimentation.

Courage, Didier!

> Is there a freeware PC NFS ?

I've just found one on Simtel... any mirror should have it, but here
is the full address where I found it:

ftp://src.doc.ic.ac.uk/packages/SimTel/win95/winsock/trn3220b.zip

This is described as "Tropic NFS Server v2.0b for Win 95/NT/Win32s"
so it should work. There is also an FTP deamon there as well, if FTP
between the two machines is also wanted...

If anyone tries and succeeds with this, tell us. :)
[I may try again, if I can avoid damaging my dial-up account's settings]

Anthony

I use STiK 1.12. To quote myself again:
>>Putting the card out of the MegaSTE, with the same configuration, solves
>>the problem at once.
My connection, until I plugged the NOVA card, was very reliable. Too bad
you cannot help me :), but maybe I can try to help you. You say you are at
38k4. What kind of modem do you use? As you surely know, the modem
connection should be quite higher than the speed you want to achieve. For
instance, to connect at 14400, you need at least to set your baud rate to
19200, otherwise overflows could occur. Now with newer protocols the
things can get even worse than that, because of the auto compression
protocols. For instance, with my 33.6 modem, anything under 57600 is not
safe at all, because the rate of data beetween the modem and the computer
can go up to that limit. When I first got my Internet connection, I first
used 38K, like you do. And I experienced a lot of trouble. With a little
help from my provider, I went to 57600, and never had a problem since,
until I got the NOVA card. So perhaps you should try this.

Wish I could help with your VME problem. Is your MSTE a box stock machine?
Have you checked to see if it is not a DMA problem and not the serial/modem port?
Have you noticed anyother data on the drive beginning to get flakey?

I have settled on
HSmodem 7, STiK 1.12 and Cab 1.5 (030). Newsie, I though was giving me problems.
I tried everything from dead stock machine to AES 4.1 and Mint040. I tried
with no serial patch and fast serial. I dicked with the fast ram setting
and fast load setting. I don't think there is anything left to check.
There are nights when I can run Newsie for hours on end without problem,
and other nights it crashes out constatnly. I honestly think it has some
thing to do with my ISP, but that I can't test. It seems more apt to crash
out during active hours, so it may have something to do with the way it is
dealing with the incoming data, or it is getting data it dosen't like sometimes.

If you got your NOVA working, you know that in the beginning you should have
removed the nvdixx.sys files from your gemsys folder. You should have also
replaced your assign.sys with the one that comes on the NOVA disk. NVDI should
also run after the NOVA drivers. I have V2.6.1 of the NOVA drivers, and under
AES 4.1 it runs full tilt on the Afterburner. Under plain old TOS, I couldn't
run the A/B with the caches on with the NOVA installed.

Hi,

Is there a way to get the same color palet as the Falcon TC mode
on a NOVA graphics card? I tried the software that came with ScreenEye,
and it works fine on the NOVA card in 16,24,32 bit mode except the
colors do not match, and as far as I can tell, I can't adjust the palet
to match on the NOVA. I can't set the NOVA to 15bit to test that idea.
The Screen Eye is a video capture card, simular to Expose (but not as nice:).

Thanks

Unfortunately, I will not able to help much. My NOVA card is 15bit or
24, not 16. Anyway, above 256 colors, there is no palet at all. I do
manage to have the correct colors with PICCOLO or GEMVIEW in either 15 or
24 bits. But the MagiC icons, for instance, do not match in either mode,
while they are correct in 256 color mode. From what you tell, I do suspect
ScreenEye is not asking gently the colors from the VDI, but instead
insists on having them mapped "its" way, supposing every one owns a
standard Falcon.

First, thanks for the quick answer.

Following your advice, I did try Fast_Serial from your home page. I did not achieved any correct (i.e., without corruption in the end) download with it, even on plain TOS with NOVA card removed. Also the CPX had strange behaviors, not showing always the same buffer sizes, and sometimes changing the available speeds. By the way, 57600 *is* standard on MegaSTE, it is not the same as on the TT.

So I got back to HSMODEM.

In the end, I tried a silly idea (but I had to try something), I removed the MODEM CPX. Now the situation is a little better. Last time I tried (this kind of test is time and money consuming), on 3 downloads, only one was corrupted. Without the NOVA card, same configuration, I did achieved 5 on 5.

Anyway, it was good to have something to try other than HSMODEM. Thanks for the trouble.

I wish I could check this. Any suggestions?
>Have you noticed anyother data on the drive beginning to get flakey?
That do happen from time to time, but I am mainly used to it :) The
problem usually occurs when a programs insist on writing files to an
already full partition. NEWSie is very good at it. Last time it was with
the horror spam. That do not makes me suspect a DMA problem, but who
knows?
>
>I have settled on
>HSmodem 7, STiK 1.12 and Cab 1.5 (030). Newsie, I though was giving me problems.
Same for me, except that CAB is for the 68000, as I am on a MegaSTE. No
peculiar problems with NEWSie. It does mixed two messages from time to
time, but it never bombs on me.
>
>If you got your NOVA working, you know that in the beginning you should have

M I S C
[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-][-]

If you want something listed below - MAKE ME AN OFFER!

Item : ATARI LAZER 'adapter' box. I can't remember what these are
called.
Comments: But they are the boxes that plug into the computer
and the lazer printer plugs into this box. Comes with the
Lazer printer cord. And 1 DMA cable (as it's built into the
box) This box also has a DMA pass-threw.

Item : 6 (?) MFM hard drive mechs.
Comments: I don't know what works, and what doesn't. They all did work
when I put them in the box, but I cannot test them at this
point.

Item : Blitz Cables
Comments: Allows you to backup your software fast and easy!

Item : ST Sound Digitizer
Comments: Made by Hippo, includes software and cartridge

Item : Video 1000-ST
Comments: Includes Cart and german (paper) docs. Screen rez enhancer (?)

Item : Video Key
Comments: Lets you hookup your atari to a TV

Item : Mouse Master
Comments: Lets you click over between a mouse and a joystick on 1 port
(usually 0)

Item : 1040 power supply
Comments: Needs plug put back on (which I still have)

Items : SwitchBack
Comments: Difficult to explain what this is. This lets you save anything
to RAM or a file. (Not the best explanation, but best I
can do)

If you have any questions, or your interested in one of the items
listed above, PLEASE Email me! All funds must be in US Dollars.
If you respond here, PLEASE keep the same title so that I can easily
find it.... I will ship ANYWHERE.

One final note: If you email me wanting something, make sure the return
email is good. If it's not, leave me a good email address in email! thanks

>downloading the bodies, the bodies do not exist ont he server as they
>have already been cancelled.

Yes, it could be interesting to have a kill-on-message-ID mode in NOS,
not requesting articles with patterns <*@kidsoft.com> or <*@epo.nl>, but
requesting the others with nntp ARTICLE command and not HEAD then BODY
like with normal kill file in use. I'll suggest it in Mike de Petris NOS
mailing list.

In the meanwhile I used a trick to solve this problem:

1) Start nntp session as usual, in "nntp trace 3" mode.
2) Just after end of server's reply to the NEWNEWS command (just before
articles downloading) hangup the modem (power off).
3) Do not "exit" NOS, but reset the Falcon so that NOS don't delete it's
temporary files...
4) Find in root of the NOS partition the temp file containing the IDs of
new messages, something like $$4N2AAA perhaps.
5) rename it as "get" and copy to spool/news/ folder.
6) edit it to delete all lines with kidsoft.com or epo.nl.
7) [not necessary] play with GNU textutils "sort", "uniq" and "comm" on
said "get" file and a copy of spool/news/history to delete in "get" lines
present in history... so you don't download twice some articles.
8) edit spool/news/nntp.dat to set the date and time of last successfull
news session to 2 or 3 minutes before you kicked nntp here in point 1.
Don't forget it's GMT time here.
9) dial, connect, and kick news... and wait until normal end of session.
10) verify the "get" file was deleted. If it's not, and it contains some
Message-IDs, these were unavailable on the server. Delete it.

Bye! Bruno.

Personally, after months of struggling with HS-Modem not working
as it should (with all due respects for Harun Scheutzow), I have
permanently replaced it with Fast_Serial. This works flawlessly,
and does support a Modem 2 modification which allows better baud
rates (57600, 115200, 230400) if found. There is also an English
version of the CPX, found in the Fast_Serial archive on my page.

Greetings from 1stfamily,

As we all know unlimited Internet access is $19.95 / month
with every major Internet access company. From Netcom to
AT&T that price never changed. So what makes us any
different when we are also charging $19.95 / month ???

Our Marketing Plan.

Our method is this. Unlimited Internet access for $19.95 per
month. If you find our service to be extremely satisfactory,
in which we are sure you will, you can refer our service
to 10 of your friends and family. If you do , you will get
free Unlimited Internet access with your e-mail address
for life !

What we offer is this:

* The fastest, clearest Internet access in the world.

* World Wide Internet access in over 110 countries.

* An e-mail account that is also life time free if you refer
10 of your friends and family to using our service.

* America On-line for only $10 / month !

* Much much more that will amaze you !

Our plan is by the year 2005 we will be the world's ONLY
Internet service providers. With our technique of offering you
life time free Internet access we will be.

Please visit our web site http://www.freeisp.com/ any where
from the world to know more about our opportunity and to even
get on the wagon before every one else beats you there.

http://www.freeisp.com/

Please forward this message to all of your online friends. Wouldn't you
want all of them to get free Internet access ?

Abdul (SPONSOR ID # SAF5197)
Stop paying for Internet access !

Hi Roger, on 17 Jul 97 you wrote: ...respect, brethren
r>
r> I'm confused.

Get to the back of the line... B^{)

r> I have been fortunate enough to get a TT and thought that one of the
r> big advantages would be that I could run the modem at a higher DTE.

You can, if you can find rates compatible between port and Modem.

r> Gasp! I stuck the HSMODEM7 kit on the TT and find that intelligent
r> comms programs recognise that high DTE is available on Modem 2 and
r> Serial 2. However, I do not appear to be able to drive the modem
r> above the rate I used to use, 38k4.

The problem is that while the Modem 2 port will support speeds of 76k8 and
153k6, your modem is likely not to support these - but will support 57k6 and
115k2.

r> Surely something is wrong :-(Anyone know what it might be, please?

It's described well enough in the German part of SCC_X.TXT which comes with
HSModem. Rumour is that an English version of these docs has been available
for some time but the author will not authorise their release until the next
version appears.

r> The only diagnosis I can make is that the modem circuitry is too slow
r> to respond to rates >38k4. The leaflet which came with the modem says
r> "115,200 bps Throughput" so I hesitate to believe that this is the
r> case.

It's the compatibility-of-rates issue that's the drawback.

The Serial 2 port *will* support these rates, but I hven't been able to work
out correct settings for Serial 2 in conjunction with my Graphics card. Can
anyone supply me with settings that are known to work?

I've rigged the VME backplate so that it squeezes past the Crazy Dots VME
card, but I can't get any success out of it with my 33k6 modem.

If you are talking about read/write protecting JAZ drives this has been
supported by HDDRIVER for quite a long time and a lot of people,
including myself, have already used it without problems. (Some of my
beta tester, for example, have a JAZ.) Please check the manual.

Hi Didier,

I'm not the brightest hardware guy, but what I found with the TT might
be of interest. I was playing with the system clock. I kind of did the
same mod that one with a Falcon would do if they were going to increase
the clock speed. What I found was at 48mhz, I had to remove the additional
2mb memory card to get the video to work. When I brought the clock down to
40mhz, I could reinstall the STRam card and video worked witout problem.
This dosen't pretain to you, but what may be of interest, was that I had
mucho SCSI problems with a 40mzh system clock (I didn't downclock the DMA).
But, the DMA port with an ICD link gave no problems what so ever.
So, if you are using the internal SCSI, a good way to check for problems
would be to borrow an ICD Link (or something like that available to you
in Europe) and work off that drive. It may not be worth the effort as you
say you only have intermittant drive problems, and constant problems with
downloads. I only guess that your files were being messed up by bad DMA
transfers, not modem routines. Usually if it is a drive problem, within

a day most of your drive is trashed.
Clear as mud?:)
You might want to find George Archers maus address. He us usualy very good
about replying right away. Even the guys on the maus will sometimes answer
a message in English (or maybe French:) if you throw in a few German words:).
Alternately, Nima at Homa HOuse Systems in Canada seems to know a lot about
the cards, but response time is usually much slower.

2178. Update on efforts to network ST<->PC

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-21 00:00:00 UTC
From: sig@end.article
Message-ID: <sig-2107970956330001@47.85.0.99>
Source record: 16363

This describes my attempt to setup a ST<->PC network connection.

Atari setup is a 4 MByte STFM, TOS 1.04, MiNT 1.12H5, MiNTnet 1.01, KGMD setup.

PC is a 120 MHz Pentium, Win 95.

Serial port connection (PC com1 to ST modem1 (renamed ttya).

PC serial port configured to 9600 baud, 8 bit, no parity, one stop bit.

To test the connection, I used a PC comms program to send characters to
the ST's serial port, displaying the characters with 'cat /dev/ttya >
/dev/console'.

This worked as expected.

I did this in the other direction, success also.

I then selected the 'direct cable' connection on the PC, setting up the PC
to listen on the port (host mode).

I first tried 'slattach' on the atari side, then 'pppd'.

The PC dialog box changed, indicating it was trying to validate logon,
then gets no further.

I tried this again, with the PC set up in 'guest mode'. Nothing.

I went back to displaying the serial port characters on the console, & got
some really unusual characters, square roots, sigmas,superscripted 3. This
was repeated every time the connection was attempted.

The PC's log shows that some bytes were received, but it shut down the
connection.

I have no idea how to set the PC to ignore login validation.

If it insists on an Account Name + Password, then where is this stored on
the PC?

Looks like I may be 90% of the way there.

Right! I shall ignore Modem 2 - it would need a h/w mod. to fix the
rates to suit modems. (Something funny there??? A "Modem" port which
does not deliver modem rates ... hmmm)

>The Serial 2 port *will* support these rates, but I hven't been able to work
>out correct settings for Serial 2 in conjunction with my Graphics card. Can
>anyone supply me with settings that are known to work?

Unfortunately I don't have this problem (anyone got a graphics card
for sale?).

Tell me though, Harry, why don't you use Modem 1 which will give the
same rates as Serial 2 (bar the silly one of 230k!)

My reason for not targetting it is that it uses the old MFP chip which
might give probs. at high DTE. Is this the right reasoning?

2180. HD and SDMA troubles on Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-21 00:00:00 UTC
From: Cedric Moreau <cedric.moreau@mail.dotcom.fr>
Message-ID: <01bc95e4$3d4efc80$689360cf@pc-2.videotron.ca>
Source record: 16365

I got a lot of troubles with my SDMA on my Falcon in "high"
relolutions
(800x600 16).
I try a lot of things to patch this:
-a buffer with a 74F04 (from Robert Schaffner "DoItFalcon")
-take a wire directly to the SDMA chip (instead of going thru
the motherboard)
But it does nothing.

I eard that i could be a timing problem.
What signal should i delay (SDMA clock or CPU and others
clocks).
How much should i delay ?

For Sale

Immaculate condition HP laserjet 2 laser printer, only very light home use, new toner cartridge fitted, memory expanded to 1.5MB, serial and parallel connection, all manuals.

300 UKP o.n.o.

(very heavy so UK sale only considered)

contact Simon if interested on WilliamsSG@cf.ac.uk

Good - validates that the connection works.

> I first tried 'slattach' on the atari side, then 'pppd'.
>
> The PC dialog box changed, indicating it was trying to validate logon,
> then gets no further.

This is promising... I guess this mean that the first part of the ppp
login has occured (although maybe it is worth checking that it wont
accept just random data and change the dialogue to validating logon...)

> I have no idea how to set the PC to ignore login validation.

Right... I can see no easy way of disabling this... however...
in the registry (windows\regedit.exe) you will find:

My Computer\HKEY_LOCAL_MACHINE\Network\Logon

I have a key called 'ProcessLogonScript' which has the value 01.
I suspect that if you changed this to 00 then it wouldn't bother
with the logging in process...

*** WARNING *** editing the Windows 95 Registry can be DANGEROUS.
Do it at your own risk! (I see no reason why changing this would
cause problems, but...)

Its probably wise to make a backup of your registry before starting,
so that if you are forced to boot into safe-mode to restore your
system you haven't lost your other softwares settings...

> If it insists on an Account Name + Password, then where is this stored on
> the PC?

Under the windows control panel, I have a "Password Properties" dialogue.
This gives me the option to change my windows password, and also remote
adinistration of this computer via a password... I guess you want to set
the windows password, and username can been seen in the registry in
the above place...

> Looks like I may be 90% of the way there.

Yea, looking promising...

Anthony

In article <5qsf8p$3fu@belzebul.imaginet.fr>
ddc@imaginet.fr (Didier Briel) said:-

>to connect at 14400, you need at least to set your baud rate to 19200,
>otherwise overflows could occur.

No overflows should occur if you use flow control, either Xon/Xoff
(software) or RTS/CTS (hardware). The last is the best. One should never
more use Xon/Xoff on modern systems.

But it remains true that for best performance the dte speed should be
theoreticaly 4 times higher than the dce (line) speed. In fact it seems 2
or 2.5 times is enough. I use 57600 bps (*2) for my 28800 bps modem and
that's perfect... I could use 76800 bps (*2.66), but my modem don't know
this intermediate speed. And at 115200 bps (*4) my Falcon Modem2 port is
not reliable, I get errors. Especially in high screen resolutions, with
MultiTOS loaded, with a background module player, or if I move the rodent.

Bye! Bruno.

The best bet is the idea of black tape over the HD hole. It's best
to format it in the P.C. in Dos and use FORMAT A: /F:720 /U.
The "/U" will tell dos not to read the existing format first.

I'm sure I've done them in the Mega4 using ACopyST or Bit36.

Even though the Atari should format it OK, you still should use
tape over the hole when you use it in the dos box.

BTW the /U switch is only available in Dos 5 or above if I
remember correctly.

There is a program floating around GEnie and I'm sure a
few of the FTP sites over your way called TOSIMAGE.PRG.

It makes a single file of your current TOS from ram.
It makes a 194k file of TOS 1.4 (1.04) but I haven't
found a use for it as of yet.

Since the high density writes with a stronger signal, to re-format a
previously formatted as 1.44 diskette to 720k, works, but, you may need

to format them 2 or 3 times. When you get it to format completely, do
it one more time. It will be more reliable then.

I have done this many times.

2190. Hardware details of parallel port?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-22 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <KBPOCSE@tos.pl.net>
Source record: 16375
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

It recently occured to me that the parallel port could be useful for use as 8, or maybe 10 (counting the strobe and busy lines) digital outputs. I guess that if the port is bidirectional, it could also be used to input digital data in a similar manner.

However, I need to know how to turn individual pins on or off, and make them _stay_ that way. If the port cannot do this, perhaps I could use a buffer IC, with the enable line connected to the strobe pin or something like this. Not being familiar with the workings of the parallel port, however, I would be unable to do this accurately.

So can anyone explain exactly how this port does work for normal data output (from the hardware point of view), and whether it is possible to cause pins to stay on or off for extended periods?

Also, can the port act as an input, and how would I cause it to act in this way?

Your assistance would be appreciated.

Apologies for cross posting

We are part of a group conducting research into the issues surrounding the post hoc rescue of digital materials and we would appreciate any help and information. Our study aims to examine the approaches to accessing digital materials where the media has become damaged (through disaster or age) or where the hardware and software is either no longer available or unknown.
The mains aims of the report are to survey current activities, identify significant (both in
terms of information value, complexity of rescue, and quantity of information recovered) rescue projects and describe how the rescue issues were approached and what lessons were learned during the rescue activities; to examine the kinds of data formats and types that can be rescued from the vantage of hardware and software; to examine the issues rescue from media whose format is unknown, where the hardware and software for reading the media no longer exist and where the media has become damaged.
We would be particularly grateful for examples of rescue projects that have issues relevant to our study as well as any technical information, whether established procedures or new and emerging techniques.

Yours sincerely

Since I don't have the drive anymore (its meantime before failure turned out to be 72hrs!!) the point is almost moot. I have to point out however that both in the manual and the software I have received from System Solutions (HDDriver 6), there is absolutely NO mention of the Jaz. There is information and options for the Zip drive, but it doesn't work on the Jaz (at least it didn't on my Jaz while it was still working).

BTW, what does HDDriver 7 offer over version 6 ? And what optimizing and HD utility tools do you recommend for use under HD Driver? (ICD have their own utilities bundled with ICD Pro.)

Thanks,

Stephen Angelini / trax@cedep.com

Hi,

I want to install High Density drives in both my Ataris (4Meg Ste and a Mega ST). I have enough information to handle the hardware mods required but I need details regarding EXACT models to use and how to configure them from people who have successfully installed High Density drives in their Ataris.

I need: Exact Drive Model # and Manufacturer
Exact Dip-switch and/or jumper configurations used.

I don't want to touch the mod unless I've got a drive that I KNOW will work.

Thanks,

Stephen Angelini / trax@cedep.com

> I did this in the other direction, success also.

Good thing.

> I then selected the 'direct cable' connection on the PC, setting up the PC
> to listen on the port (host mode).

What sort of connection is this 'direct cable' thing ? It sounds to me as if
it were one the many PC connection programs with their proprietary protocol.
In that case of course it can't deal with IP, or PPP packets, sent from the
Atari side.

In case you really have a TCP/IP stack here doing this 'direct cable', make
sure to select the same protocol (SLIP or PPP) as you use at the Atari.

> I first tried 'slattach' on the atari side, then 'pppd'.

Here is a contradiction in terms, I'd say. The slattach, as the name says,
attaches a SLIP device, while the pppd tries to run a PPP across the line.
This of course can't work. Choose either one, but I'm sorry I'm not familiar
enough with MiNTnet to give any detailed advice here.

As I understand, the procedure with MiNTnet can be
- use iflink to assign a SLIP or PPP channel to the serial port you're using.
- use ifconfig to get the interface 'up', and assign an IP address.
- use route to add a default route to the SLIP or PPP channel.
- if you chose PPP, now the pppd would negotiate a PPP connection.
SLIP doesn't need to negotiate anything, it just sits there waiting for data
to receive, or sends some, respectively.

Of course the port parameters, like speed etc. must be set first. Read the man
pages for the commands.

> The PC dialog box changed, indicating it was trying to validate logon,
> then gets no further.

If I was right guessing about this 'direct cable' thing, than it would mistake
some Configuration Request packet from the pppd as an attempt to login. If the
protocol really is a proprietary one, then of course it doesn't understand the

request.

> I tried this again, with the PC set up in 'guest mode'. Nothing.
>
> I went back to displaying the serial port characters on the console, & got
> some really unusual characters, square roots, sigmas,superscripted 3. This
> was repeated every time the connection was attempted.

Sure, IP or PPP packets are not designed to be readable on a terminal. They
contain binary data.

Hoping this will help in any way.

Cheers Peter

: This worked as expected.

That means the serial link is working.

: The PC dialog box changed, indicating it was trying to validate logon,
: then gets no further.

It may be better to have the PC log into the ST, rather than the way you
are currently doing it.

I would do it this way:

Edit /etc/ttytab so that the serial port you are using is turned on. This
way you can use a terminal program on your PC to log in to your TT. When
you want to use a PPP connection, however, the PC only needs to send the
"pppd" command to the TT (assuming the account you logged onto has a
normal shell), and then start up PPP itself and the connection should then
work. You could also set the shell for the account you will be using to
pppd, so that it goes into pppd as soon as the login is complete. On the
PC side, you would simply need to set the chat script up correctly.

: I went back to displaying the serial port characters on the console, & got
: some really unusual characters, square roots, sigmas,superscripted 3. This
: was repeated every time the connection was attempted.

This is probably because something changed the speed of one of the serial
ports.

So take this official information from me: The demo version of HDDRIVER
7 is already available on
http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html.

The non-demo version will be available next week latest. So if you order
HDDRIVER you should explicitly ask for HDDRIVER 7. You can be sure that
System Solutions will get this version from me in a few days.
But please take into account a certain delay because they might want to
update their README etc.

> than the current mismatched one.

I don't have all the previous postings available now. But if you're
talking about the Afterburner: Since HDDRIVER 6.3 you can boot without
any tricks. Note, however, that if you don't have an IDE drive connected
to your Falcon with Afterburner but only a SCSI drive, you won't be able
to boot from SCSI. This is because the Afterburner doesn't initialize
the 68040 cache correctly and has nothing to do with HDDRIVER.

> I was also hoping that the newer version of HDDriver might stabalise the
> Falcon, but a bit of soldering appears to have rid me of the SCSI

A hard disk driver can't stabilize an unstable system if the hardware
isn't working properly.

BULLETIN FROM JEFFREY G. HAMMER, MIST SHOW CO-ORGANIZER:

It's almost here! Don't miss it! Possibly the last Atari Show
in the United States!

Saturday, July 26th, from 10 am til 3 pm. (Chicago time)
Post Road Community Center
1313 S. Post Road (south of Washington St., US-40)
Indianapolis, Indiana, USA
Admission: $1

Vendor/User Group/Seller list:

This is a list of vendors that have confirmed they are coming
to the show. (We are SOLD OUT.)

Nashville Atari user Group
Emulators, Inc (Derek Mihocka)
FMH Games
LCACE
ACORN - R. Magdich
LAG
ICD
Doug Palmer
It's All Relative
Systems for Tomorrow
SCAT
Donald Turnock
chro_MAGIC / Crawly Crypt
Sanjay Parker
Chris Danyi
Tom Tolman
TOTAL: 24 tables plus MIST plus Jaguar

NOTES:

Missionware will not be there. There may be software available.

Clear Thinking (Edit Plus - Craig Harvey) will not be there.
There will be software updates available.

Toad most likely will not be there.

ICD will run networked Jags, with Battlesphere. He will also
have a limited number of another Jag network game available for

sale. (made by another vendor)

Stephen Angelini wrote:

> that both in the manual and the software I have received from System
> Solutions (HDDriver 6), there is absolutely NO mention of the Jaz.

This is because there won't be a new manual any time a new drive is
available. As soon as it was clear that JAZ and ZIP work the same way
concerning read/write protection the HDDRIVER README and dialog boxes
displayed JAZ in addition to ZIP.
> is information and options for the Zip drive, but it doesn't work on the
> Jaz (at least it didn't on my Jaz while it was still working).

So you did something wrong. I tested it myself and other users including
my beta testers confirmed that it works. It wasn't necessary to change
anything related to JAZ drives. Everything works exactly as it works for
ZIP drives.

> BTW, what does HDDriver 7 offer over version 6 ? And what optimizing

Have a look at the demo version and the changes list available on:

http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html

and
> HD utility tools do you recommend for use under HD Driver? (ICD have their
> own utilities bundled with ICD Pro.)

You can take any tool you want. Optimizing doesn't depend on the hard
disk driver because it does nothing driver specific. For my own part I
use DISKUS for this purpose but there is no English version available.
(http://acp5.chemie.uni-kl.de/seimet/diskus_english.html)

One of, resp. AHDI OR HDDRiver, is enough for a simple Falcon ;-)
If you use HDDRiver, you don't need AHDI too.

>I was also hoping that the newer version of HDDriver might stabalise the
>Falcon, but a bit of soldering appears to have rid me of the SCSI timeouts,
>just need to stop the occaisional lockups then I will be laughing!

That's not a problem of any HD-Driver, that's only a problem of the f*cking
Tramiels and the part of 'save money by create a Computer board' !!

Note: Our Falcon is not more as a simple 16Mhz STe !!
All 'special' Parts like a 68030LC CPU, a DSP and that bloody DMA Part in
a Falcon are not a developmet for a nice high end atari machine.
All parts a include with some gal logic..
Somebody call that: a emulation ..

Your problem with the stucking scsi transfer is a part of the internal clock
and a smal DMA-Subsystem. The one and only chance to fix that complete is to solder!
Have a lock for some descriptions called 'clockpatch'
98% of all Falcons are working well with that hardware patch.
It's easy to fix, but only for techicans ..
In some machines it's must be tricky, but it works.

Ask DOITF030 if you have some hardware trouble with a falcon.
You found descriptions and schematics.

Regards, Robert

I have been trying to get a ST & PC to connect, with no success so far.

What's your secret?

I have also talked to people who have tried connecting Win 95 to Win 95
machines, with no joy. Msoft did not make it easy to use, & don't seem to
have produced any technical bulletins to educate users.

Still, I will keep trying.

2208. A Scrolling Display With a Static Area

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-23 00:00:00 UTC
From: mlake@melake.erols.com
Message-ID: <slrn5tc6ch.5dv.mlake@melake.erols.com>
Source record: 16393

I'm writing a program that is doing hardware scrolling. I want to have a small static area on the screen to keep some status info. The static area can be on the top, or the bottom, or on one of the sides ... though my preferences I think would be 1., bottom, 2. top, and 3. a side.

What are some recommendations of ways to keep a static area? An HBL interrupt? Is there an easy way using hardware scrolling to scroll only a portion of the screen? If so, I don't see how. An other ideas or recommendations? Some example assembler code would be a great help.

TIA.

2210. Update on efforts to network ST<->PC (answer at last)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-24 00:00:00 UTC
From: sig@end.article
Message-ID: <sig-2407971128280001@47.85.0.99>
Source record: 16297

I have finally tracked down some real answers to my problem of connecting an ST to a PC over a serial link.

It seems that the WIn95 direct cable connection link DOES NOT OR CANNOT USE TCP/IP. Peter Rottengatter was right.

Maybe Msoft will add this in later, but for the moment this type of link is only usable from Win95<->Win95 or Win95<->WinNT.

However, there is hope; as I found a page which had a null modem driver for Win95. The docs are sketchy, but it looks like you can configure Win95 to connect using the Dial Up Networking option without having a modem connected.

I am hoping to be able to 'dial in' to the ST, & use NFS to remotely mount drives.

Msoft don't give good tech manuals, but I believe it meant to be PPP, &
you can use TCP/IP. I have also founf a Win95 update that gives scripting
& also allows SLIP connections. This probably only works over a modem
connection.
>
> In case you really have a TCP/IP stack here doing this 'direct cable', make

I only use 'PPPD' now, I gave up on 'SLATTACH'.

PPPD seems to startup ok, I get the right messages anyway.

>

> request.

Yes, this is possibly what's happening.

The connection hardware works; I can even check the PC PPPLOG & see that
56 bytes were received. I expect there is some problem in software.

I even tried disabling password checking (as per Anthony Jacques post),
but WIn95 still insists on validating user name/password.
>
** Stuff Deleted **

> Hoping this will help in any way.

It does.

It's frustrating; as I have NFS ready to go on Mintnet & I installed a
freeware PCNFS which also seems to work (drives show up in the network
neighbourhood).

Does anybody know if there is a Win95 version of PPP, not supplied by Msoft?

Can anyone answer this question (reposted from CiX) please?

Email jconnor@cix.compulink.co.uk

==========
ataricomputing/qna #113 of 116, from jconnor, 499 chars, Jul 22 14:58 97

TITLE: Q&A
From Richard Mckeown, New Zealand

I have two Lantech cartridges for my Atari STe (and Falcon).

Lantech systems LT101

I don't know if you are familiar with them, but, I have a few
photocopies of the docs for them, they are 10Mb/s LAN cartridges. I
cannot find out if they NE2000 compatable, and do you know of any
software for then, as I have no software for them.

They take BNC connectors (like thin ethernet cables)

Any help would be greatly appreciated...

-!-
Anyone?

Joe

Regards, Derryck

I'm pretty sure that PowerNet supports them. The cartridge port is
however not capable of 10Mb/s, so don't expect that sort of speed. 8-)

All the best,
Daniel

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive and Lots of 8 Bit Disk SoftWare for $5 each.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP.

This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Can you not tell W95 that this is a "normal" connection, and just tell it not to wait for dial tone, not to dial a number, in fact not to do anything but just get on with PPP?

(Note that I know nothing about W95, I'm just trying to think how to do this on a normal system)

> Also, can the port act as an input, and how would I cause it to act in
> this way?

Yes, yes, yes ;-) The port is bidirectional, but only has 8 data lines (fed by the sound chip PSG port B), Strobe (PSG port A bit 5) and Busy (MFP general purpose register bit 0, also timer A input).

Unless you're VERY time critical, I'd suggest to access the port via XBios calls. Giaccess() (Gi is for General Instruments, who made the sound chips in many machines) lets you read or write port B (register 15), while Ongibit() and Offgibit() lets you turn on and off individual bits of port A (only bit 5 is interesting here). Using Giaccess() you can also read register 7, manipulate bit 7, and write register 7 back, to control the data direction of the port. Mind you at system boot TOS sets it to output, possibly causing a short circuit with badly designed hardware. Find the Busy bit at bit 0 of register 0 of the MFP, the location being $fffffa01, for polling. For using interupts or the timer I suggest you grab a datasheet on the MFP 68901, as it's capabilities are immense. For interupts, XBios Mfpint() helps only a bit.

Cheers Peter

Win95 is very picky about port usage, if you try to share the serial port
with another program, it complains.

The Direct Cable connector program seems to use a lot of resources that
are common to the Dial Up Networking.

It would make sense to log in from the PC.

You could also set the shell for the account you will be using to
> pppd, so that it goes into pppd as soon as the login is complete. On the

Not sure about this, as the speed is always correct when I check.

Thanks for the idea about PC login, I need to read up on 'ttytab'.

:-(

> Maybe Msoft will add this in later, but for the moment this type of link
> is only usable from Win95<->Win95 or Win95<->WinNT.

Thats odd... I was standing in the local bookstore reading techy Win95
books, and I found one ("Windows 95 for system administrators" or something)
which described how you could use a TCP/IP link to network with a local
unix box... I didn't have enough time to memorize what you had to do, but
it definately gave the impression it was possible... I might check and see
if the book is still there...

I I think that the Epson SMD 380 720k floppy drive (A:\) has failed in my 1040 STe (TOS 1.62) Is this common? Computer was new in the box in 1992.

Where can one obtain a replacement drive which will vaguely fit the opening in the Atari case? Currently I have borrowed the drive from an old SF 314 which is functioning but I can't put the case back together due to the old-style Atari 4cm eject button.

Hallvard, if you are reading this you may just know the answer, and by the way have you seen any of the copies of XEST published by the Nova Scotia Atari Computer Users Group in the last 9 months? You have been extensively quoted and published.

I would suggest that the Toshiba would work fine. DON'T format it. I don't think ICD will allow a format on the IDE drive anyhow. Just partition it as usual and all should be well.

Right, don't format it. However ICD Pro 6.5.5 should handle the drive
just fine. I have an older version of HD Driver and it has a little
difficulty partitioning large IDE drives (V6.3 up is fixed) so I used
IDC Pro just to partition the drive, then installed HD Driver without
problem. Compatibility shouldn't be a problem between the two with that
size drive. If your going from a Conner to the Toshiba, you will be in
for a nice suprise:)

2229. More results (was ST <-> PC Network)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-25 00:00:00 UTC
From: gigxr01@error.com
Message-ID: <33d86e70.59132053@47.8.2.174>
Source record: 16314

I have given up on the Direct Cable Connection option, I have
successfully installed a Null Modem driver in place of the modem on
the PC.

I have been able to 'dail up' the ST& get a login propmt.

The problem is; as soon as I enter a username & press return, login
crashes on the ST (Bus Error). I have no idea why.

This kills getty

My setup is, KGMD on a 4 MByte STFM, TOS 1.04.
I have installed MiNTnet 1.01.

To get the serial line login, I edited the file 'ttytab' & set up ttya
as a 9600 baud dial in. I admit I do not fully understanding the
workings of the 'ttytab' file.

Login crashes whether anybody else is logged in or not.

Hopefully I can resolve this soon.

(There is probably a way to get serial connections without a user id &
password, but it sounds like a lot of hacking). I guess it would be a
serious security violation, but I could live with it for test
purposes.

I also installed an upgrade on the PC Dial up Networking side.
This now gives scripting & a CSLIP option (previously only had PPP).

I assume that if I can correct my login problems, I should be able to
'dial in', logon, & run 'slattach'.

Just about any 2.5" internal IDE drive should work with the Falcon. I'm
not familiar with that exact model, though. I would -not- format any IDE
drive. In fact, I'm using ICD's Pro drivers v6.5.5 and I don't think it
will even let you format a IDE drive. You can partition it though, and
it will map out bad sectors 'n stuff then... Formatting an IDE drive can
easily result in damage to the IDE drive. BTW, while I've gotten good
service out of ICD's Pro software, it is rather dated (although I heard
a rumor that an update was coming)...and I will probably switch to the
HDdriver software, which is more capable and is very well supported. In
fact, the author posts messages in the Atari newsgroups all the time! ;)

First of all, whatever you do, -DON'T- write anything to that disk! TOS
marks deleted files with an " * " at the start to let the system know that
the space taken up by that file is now available for use. If you copy a
file to that disk-it might overwrite your old, deleted file. Get ST-Tools,
it should be available at most fine BBS's and Atari ftp sites. It will find
all files marked with the asterisk, and "undelete" them for you. ST-Tools
is a great program, BTW... Good luck...! ;)

PS Off-topic but all this reminds me of a poem I once read:

Pretty Mary donned her skates;
Upon the ice to frisk...
Wasn't she a silly thing;
Her little *...

Source record: 16325
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well, sorry about all these followups to my own post, but it seems I have
at last found the answer to the problem.

The Atari Compendium, under the MFP section in the memory map has the
following entry:
"MFP-ST General Purpose Pins (Parallel port data register on Atari
machines)."

I thought this was referring to the parallel port where a printer would
normally be connected, but evidently it refers to something else.

As it turns out, the parallel port is controlled via the sound chip, and
with the help of Atari ST Internals I am now able to read, write and
change the direction of the parallel port.

The only thing that I still haven't worked out is how to control the
strobe line. Even though I set the appropriate bit in the sound chip port
A register, the strobe line is always turned on.

Hopefully someone has found this to be of interest...

If it's a standard Atari disk, bung it into a PC and use UNDELETE. If it won't read the disk, then there's various programs to convert the bootsector so it will.

There is also a very good undelete facility in Diamond Edge, that you can use on any partition. It shows all the deleted files in any directory, with the first letter as sigma (which is the delete method used by Atari) and you just replace it with the correct letter. It also tells you if the file (or parts of it) are recoverable.

There is also the PD UNDELETE.PRG which is somewhat less convenient and only seems to work with early TOSs (not 2.06) and caters for floppies and partitions up to F: only, and finally UNDEL.TTP whicb is command-line driven so you have to input the path and file name manually.

Regards
Peter

** ST Software For Sale **
** All disks and doc are original. No copies or pirated software! **

Games

Battlehawks 1942 by lucasarts. Biplane flight sim/fighting. w/Manual. $7

Wonderland (Alice in Wonderland adventure game) - w/Box, Manual, and
Maps. Works in monochrome too. Impressive game, perfect condition. $10

Prince of Persia - The classic game, hard to find for the ST. w/Box and
manual. $7

Life & Death - classic surgery simulator. w/Manual, box, & rubber gloves(!) $10

Leader Board - excellent golf simulator. w/Manual and piracy key. $7

Shufflepuck Cafe by Broderbund. Play airhockey against aliens. Great
graphics and sound effects. - w/Box and Manual. $7

Flipit and Magnose: Water Carriers from Mars - Unique platform game, has
two-player mode. Disk only (no manual) $5

Hostage Rescue Mission - w/Manual. $7

Fascination -- Adult adventure game. w/manual. 18+ please. $10

Fair Dinkum Puzzle Pack -- Word Search Creator and Crossword Creator II.
w/Manuals for both. $9

FLOOD by Bullfrog/EA. w/Box and Manual. Great Game! $7

Populous. w/Box, manual, and list of cheat codes. $7

Typhoon Thompson by Broderbund. w/Manual. $6

Stir Crazy featuring BoBo from Infogrames. w/Manual. $6

Top Gun. w/Manual. $4

Silicon Dreams and Jewel of Darkness -- adventure games. w/Manuals. $7

ST Comics -- very rare collection of interactive comic books created
entirely on ST computers. 16 disks. $10

Graphics

MultiViewer Graphica (MVG) by Dr. Bob. w/Box, manuals. $8

Productivity

Metapyschology Primer #1 by clear thinking software. Manual. $5

STalker 3 by gribnif. Excellent modem program. w/Manuals. $10

STeno by gribnif. Text editor, works great with STalker & NeoDesk. w/Manual. $10

WordPerfect (11/1 release). No docs, but I do have the keyboard layout
template and extra printer drivers provided by WP Corp tech support. $7

GramSlam 3 by Wintertree Software - grammar and style checker. w/Manual. $9

SoundLab from dmj software. Registered version with manual and bonus disk
of sound samples. $6

Flash II by Missionware Software. Workhorse modem program. w/Manual. $6

STraight Fax 2.1. Premiere fax program for the ST. w/Manual. $10

The Cryptographer by Fair Dinkum. w/manual & reg card. $7

Utilities

CodeKeys by CodeHead. Macro program and more. w/Manual. $6

HotWire by CodeHead. w/Manual. $6

CodeHead Utilities. w/Manual. $6

Diamond Edge by Oregon Research - Hard Drive recovery, repair,
diagnostics, optimization. w/ Manual. $8

Diamond Back II by Oregon Research. w/Manual. $8

Programming

Power C by MIX Softare. (This is for MS-DOS, not ST). w/Manual. $5.

Free Stuff!

Ask for a free item with each item you purchase. (Buy one, get one)
My choice, but available items include: STart disks, TOS disk, VKiller
2.2 (registered), TimeLink/ST, and more.

TERMS OF SALE

Buyer pays postage and COD charges (if you want for COD shipping) from
California.
Credit cards/e-money accepted via web page payment system, enquire for details.

I'll consider Macintosh hardware/software in trade. (No pirated programs!)

Questions, comments, alternative offers? E-mail me.

Out of the ether, the following was mentioned by us@ooc.de...:

u> I don't have all the previous postings available now. But if
u> you're talking about the Afterburner: Since HDDRIVER 6.3 you can
Ahhh, but when I last spoke to System Solutions (about 3 weeks ago) they informed me that the latest version they had was 6.13.

u> drive, you won't be able to boot from SCSI. This is because the
u> Afterburner doesn't initialize the 68040 cache correctly and has
u> nothing to do with HDDRIVER.
Thats ok, i've got an IDE fitted as well as the SCSI.

u> A hard disk driver can't stabilize an unstable system if the
u> hardware isn't working properly.
Agreed, my main problem were occaisional DMA transfer errors plus odd lockups. I've just always worked on the principle of reducing the available variables before going for the meat of the problem.

The ability to have done without AHDI was the main impetuous behind the request.

I will hang on until System Solutions make version 7 available.

Thanks for the help.

Spencer

2250. Help! What kind of HD does STE/STFM use?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-28 00:00:00 UTC
From: Mick <manze@mail.usyd.edu.au>
Message-ID: <01bc9b10$0c3ae6a0$b7394e81@manze.ucc.su.OZ.AU>
Source record: 16335

To anybody who may know...
I'm posting this on behalf of a musician friend who needs a new HD
for his STE/STFM (whichever one he owns). Basically, what happened was
that the fan in the PSU died and he kept using the machine until the HD
died - now he has to load prg's (Cubase) from the floppy. Unfortunately,
HD's for Ataris are as rare as hen's teeth here (Sydney, Australia). So,
what I would like to know is this: What kind of HD does the STE/STFM use
and/or is it possible to somehow connect a modern IDE PC HD to it?
(probably asking to much for the latter I'm sure!).

Thankyou.

2251. Mint question, why does login crash on serial port login?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-07-28 00:00:00 UTC
From: gigxr01@error.com
Message-ID: <33dc9743.158486150@47.8.2.174>
Source record: 16336

I have been trying to set up a serial connection between a STFM & a PC. (ST is a 4 Mbyte, TOS 1.04; PC is a pentium 120, Win 95).

I am using FreeMiNT 1.2.6 (also tried 1.2.5); MiNTnet 1.01 is installed, as is the KGMD package.

I can login fine on the console, & on startup, I see that GETTY is running (getty std.9600 is the actual entry).

The 'Login:' prompt appears on the PC terminal screen.

Pressing CR just causes the prompt to be repeated, but any character entered before CR causes login to quit with a bus error.

Getty dies also.

I noticed there is a second 'INIT' running.

I had assumed that Getty called Login, but why the second copy of Init?

Is there any documentation on the whole login process?

I have read the login, Getty, Gettytab & Ttytab man pages, but am not much wiser for it.

Is this a problem with accounts?

2252. atari monitor extension cable/ hard drive

Hi Roger, on 22 Jul 97 you wrote: ...respect, brethren
r>
r> On 21 Jul 97 04:16:56, Harry Sideras wrote:
>> The problem is that while the Modem 2 port will support speeds of
>> 76k8 and 153k6, your modem is likely not to support these - but will
>> support 57k6 and 115k2.
r> Right! I shall ignore Modem 2

There's a case for and against taking that route.

I'd like to have access to 57k6 but the compression speed at CiX is so fast (maybe 100k a second!) that I can compress my downloads online prior to sending and barely notice the difference (only ARC compression though). Modem 2 is a fully connected port, while Serial 2 isn't. I think this is where my problem lay, but I can't honestly remember...

r> it would need a h/w mod. to fix the rates to suit modems.

It's described in the HSModem docs.

MODEM2 of the TT using 57600, 115200 and 230400 Bauds

(Only for experts)
The track between pin 17 of the TT-MFP (MC68901) and pin 32 of the SCC (Z85C30) should be cut (or pin17 of the TT-MFP should be isolated with plastic strip from its socket). Pin 32 of the SCC should then be linked with pin 13 of the SCC. To the corresponding question (M2TT) in the configuration of the ?SCC.PRG you then have to reply that you are using a MegaSTE/Falcon, i.e. with "0"

(English translation by Mick Lock verified by Peter West 1996,1997)

r> (Something funny there??? A "Modem" port which does not deliver modem
r> rates ... hmmm)

It delivers all speeds up to 38k4, but is non-standard above that. Modems don't supply a full complement to match the higher rates that Modem 2 does support. Again, from the HSModem docs:

Clock rate and baud rate

A SCC can use different clock sources for the generation of baud rates, the system clock PCLK being the most common. The PCLK is 8MHz (=8000000Hz) in a normal (as supplied by Atari) MegaSTE, TT and Falcon. This is a good number, but unsuitable for the generation of the high standard baud rates required. The high baud rates in MegaSTE, TT & Falcon's are generated from other time sources. My hardware extension ST_ESCC is clocked at 14745600Hz.

It is possible to modify the MegaSTE, TT or Falcon with a quartz oscillator and a bit of wire to make PCLK =14745600Hz (suggestion from Franz Sirl). If you only wish to add 57600, 115200 and 230400 Bd to MODEM2, a simpler modification is possible using a single wire. More detail can be found in the section "MODEM2 of the TT using 57600, 115200
and 230400 Bauds" of this document.

The drivers detect automatically whether there is a PCLK clock frequency of 8MHz or 14745600Hz and display the rate in their installation messages.

With a PCLK of 8MHZ the following Rsconf-Baud rates are possible:

(new - old)

SERIAL2:

230400 - 200
115200 - 150
57600 - 134
38400 - 110

MODEM2:

38400 - 110
153600 - 75
76800 - 50

Additional speeds on MODEM2 when using a MegaSTE or Falcon (TT after modification):

230400 - 200
115200 - 150
57600 - 134

With a PCLK of 14745600Hz the following are possible on MODEM2 and SERIAL2:

(new - old)

230400 - 200
115200 - 150
57600 - 134
38400 - 110
153600 - 75
76800 - 50

If you use the GEMDOS-Fcntl TIOC?BAUD, there is no problem because the possible baud rates are displayed in plain text as "bit per second".

ST_ESCC always contains an ESCC. MegaSTE,TT & Falcon's only contain a ESCC if someone has changed the original IC. The driver for the SCC will run with an ESCC as well, but the reverse is not possible.

(English translation by Mick Lock verified by Peter West 1996,1997)

SCC.PRG

On the TT (and Falcon, when fitted with an accelerator with FastRAM) SCC.PRG
should under NO circumstances be loaded into the FastRAM, otherwise you will
get problems (bombs, loss of characters, spurious behaviour) because of the
fast access to the SCC. These drivers must be
loaded into physical RAM, they must NOT be loaded into virtual RAM.

>> The Serial 2 port *will* support these rates, but I haven't been able
>> to work out correct settings for Serial 2 in conjunction with my
>> Graphics card. Can anyone supply me with settings that are known to
>> work?
r> Unfortunately I don't have this problem (anyone got a graphics card
r> for sale?).

Err... me <g> But it doesn't provide all that much over and above standard
TT capabilities (800*608*256 at best).

r> Tell me though, Harry, why don't you use Modem 1 which will give the
r> same rates as Serial 2 (bar the silly one of 230k!)

Modem 1 is the same as an ST - 19k2 maximum.

Thanks, Harry, this is the sort of thing I needed to know. BUT ....
what do you mean "fully connected port"? The diagrams I have show
Serial 2 to have a Synchronous Clock on Pin 9 whereas Modem 2 has the
Ring Indicator.

What kind of SIMMs did you put in ? Are you sure they are 4x 1Mb simms ? I was once sold some 256K simms in the place of 1Mb ones. You can hardy tell the difference if you don't try them. Also, make sure the SIMMs are 1Mb ones. 2 or 4 Mb simms will only be recognized as 1Mb anyway.

The fix is to use 2.5 Mb, since TOS normally only supports 1, 2 or 4 Mb configurations, and doesn't handle the 2.5Megs correctly. You shouldn't need it for a normal 4Mb setup.

I suppose the original atari drive was a good old Megafile, which used RLL or
MFM mechanisms, which are outdated and quite hard to find too.

I suggest your friend gets an external SCSI drive with a SCSI/DMA host adapter
such as Liink'96 or ICD The Link, plus appropriate driver software. The whole
stuff costs quite a bit, but it'll be a faster and bigger drive.

IDE is possible, but is only worth it if: a) you already have the spare drive,
b)you are willing to mount an internal expansion board c) you mount the ST
and drive in a PC type case.

This is a good idea as the drive can be used on any future machine -
SCSI drives can be plugged straight into Macs, and a cheap interface
card is available for PCs.

Try running the main program for WINX (WINX.PRG) from the desktop -
it produces a TOS dump - after patching in the better window handling
code. It /should/ work on a TT - although I've never tried...

Actually, Winx doesn't dump TOS, but only the GEM part of it. And I have yet
to find the use of dumping a GEM image.

Not without a LOT of difficulty.

The SLM804 relies on using the ST RAM as it's page store. PC's don't
know about that!

I currently have a working 1040STF, and a 1040STFM with no power supply (which I assume is working otherwise).

Is there any easy way that I can use parts from the STFM to upgrade the STF? Specifically I'm thinking of hooking up the second internal floppy somehow, and possibly upping the RAM to 2MB.

Hi to everyone,

I wonder if anyone knows something about upgrading ST with 4Mb 72 pin EDO SIMM? I've just tried it and works O.K. (for now). I soldered it in the MEGA 2 ST and thing lived through 5-6 extensive RAM testing seemingly O.K. Since EDO DRAM behaves differently than normal one (drives data lines whole the time through fast page), is there a possibillity of bus contention between upper and lower half of DRAM ? I think that someone posted something about it, but can't remember if answer was pro or con.

Thanks in advance,

Branko

Source record: 16266

I'm having hardware problems with my 1040 ST. The problems have accelerated during the years (I bought the machine 1987) and I suspect that the problem is common among 1040 users. I remember having read somewhere that the problem is due to oxidation of the CPU-contacts or something similar, and that it (momentarily) could be corrected by removing the CPU (or whatever cause this problem) and putting it back and thereby removing the oxides.

The problem is observed by the following:

I suddenly get the message: "Data on the c-drive seem to be damaged" or something similar. The problem seem to be stochastic and increase after having used the machine for several hours.

I would be most thankful for any help. The problem is very important to me mostly because I have lots of MIDI-files (my own music) which I want to save.

Mail me on anders.osterberg@mbox303.swipnet.se.

:). You might get a few responses like "drop it from 6" " or the like:).
But, if you suspect corrosion, go to an electronics shop and get a good
etching cleaner. Carefully remove any socket mounted chips and clean the
sockets & chips. You should only have to use a q-tip or the like for this.
Avoid getting the compound on the pcb. Take note how well they seat back
into the socket. If their loose, after warmup you may be loosing contact.
If necessary spread the legs VERY slightly for a tighter fit. See if that
helps after it warms up. Check your HD cables as well for corrosion if
every thing is original (10 years old). Tweasers make a good tool for
removing chips, but there are proper tools for the job however.
Before you do any of the above, midi files are usually small and you could
save yourself a lot of heartache by backing them off to floppys. You might
also want to purchase a nice disk tool kit (EDGE or even Correct from the
Kobold or Ease package) to check the condition of your drive.

I'm interrested in getting copies of the TT030 scematics
and field servicing manuals, or any other docs related to
to TT hardware.

While the manuals are still available from B & C, $50 US
comes out too darn expansive for a Canadian.

Since I know several user groups have copies of various
Atari schematics, surely someone within North America can
arrange for me to have at least xeroxes of those?

Atari themselves don't have anything left. Looks like the
legacy is truely gone....

Everything Michael said, plus if you're using AHDI (Atari's HD driver) then
you might want to seriously consider switching to something like HDDriver.
Also, if you are using TOS 1.0 or 1.2 then you will want to upgrade to v1.4
at least... ;^)

Hi! I'm running Magic 4 on my Atari TT and the other night I was reading the manual and understanding more about the OS. It recomended putting wbdaemon in the AUTOAPPS folder so it would load in on boot up. I figured they meant AUTO, but that didn't do it and neither did putting it in a folder called AUTOAPPS. I can load it manually, though. Any thoughts on how to get it to load on bootup?

Also, is it worth upgrading to 5? Thanks!

From: DCroker@fortress.org.uk
Message-ID: <624_DCroker@fortress.org.uk>
Source record: 16274

Reposted from CiX, can anyone answer this question please?

Best to email me as I seem to be missing some messages.

Question:
From: garnett@ihug.co.nz
I've tower cased my Mega ST into a medium (PC) tower successfully but have
an unsightly cable going from the DMA port, out the back of the case and
back in to join to the Link and a SCSI HD. I'd like to make it internal via
the DMA pins on the Mega ST motherboard but don't know the pin setup -
there are more pins internally than externally. I've used a mulitmeter but
am not confident enough with the results to try it out. Any information
would be much appreciated! SOMEONE must know, or else why would the
internal connection be there? (haha, that's Atari for you)

Can anyone help please?

Regards, Derryck

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SLM 124
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of
Shadow Software. Older Technology made with a lesser chance of Planned
Obsolescence. Built like Tanks. The Shadow tells me each one worked
before they were taken off their Computers. Each one, $25, as is. Model
numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for
Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST
HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may
find something you've been looking for. Something you might want. Even
Something you may of Forgot! At BSC's Web Site you can View, Capture &
even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request
Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why
not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or
Feel free to Request catalogs through E-Mail. Really, it's no inconven-
ience. All I ask is that you specify Atari 8 Bit, Atari ST or both.
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I
will get back to you after the weekend. Please let me know if I can't
attach files to your E-Mail. Please Direct any and all Replies Through
E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in
Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC
Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow
Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer
Platform. Also from The Shadow of Shadow Software (my Boss) a File

called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

It needs at least a megabyte of your ram as a minimum.That's after the
ram for your program, data, fonts. A Mega 4
or better is suggested. Not a 1040STf unless it has a lot of ram.

> How can I use an Atari as an print-server ?
> Which OS can I use for it. (probably Linux would be the best choice)

There was a program called DISK DOCTOR from years ago. DDOCTOR.PRG.

In the directories, the first character is changed to a hexadecimal
"e5". You can
change that to a alphabetical character and bring it back SOMETIMES. If

the file is fragmented over the disk, you'll usually only get the first
"fragment" back.

Tos uses the first available sectors on a disk. So adding anything to
it now will
lessen changes of recovery. Diamond Edge will work as will Norton
Utilities
Disk Edit (on the PC) if it's a 720 or 1.44 disk.

Good Luck
(and always back up "important" files!)
<Glenn>

I have completed translations of both the HS modification and
the earlier FS modification. Both can be found on my page.

As for an eventual HS-Modem 8, there are rumours, but german
friends tell me even on the Mausnet, the author supposedly
reported not having intentions of making further upgrades.

Yes, it can be done, but it requires using an Atari ST computer as
an interface. The SLM804 connects to the DMA port on the ST and the ST
connects to the PC through the serial port. There is software to support
this method, although I don't have direct experience using it.

Hi David,

You can get an excellent utility called "Dump-it!" from Ben Hall. It's shareware, but really inexpensive and it does the job excellently. You can configure your own dump requests in the registered version. You can download the demo from most ftp sites (like mcc.ac.uk). Or write him at : cb170@city.ac.uk

Good luck!

Stephen

Sorry, Eric. All the host adapters use custom chips to do the work.
They are not available to the public.

I suppose that if you were to build a big enough circuit using
standard logic chips anything is possible but the lack of any DIY
circuits seems to imply that it is not very practical.

> I need help, How can I make an Atari read a pc midi file????

If it's a standard MIDI file, *.MID, then it's platform independent (i.e. not tied to a PC).

I'm assuming you know how to physically transfer the file. Ataris will (generally) read PC-format floppy disks, so you should have no problems there.

Okay. I don't know whether you're familiar with MIDI - just in case you're not, I better explain a few things. Please feel free to skip the next bit if you know already!

MIDI stands for Musical Instrument Digital Interface, and as the name suggests it's used to send information between musical instruments... which in the computer world means synthesisers. So to play a MIDI file you'll need an instrument to play it on. Many PCs these days have synth cards, or synths built into sound cards (usually pretty lousy synths!). But Ataris don't... so you'll probably need an external synth. The MIDI file contains the notes to play, and the synth will play them and let you hear the results! (That's what the MIDI in and out sockets on your machine are for. You'll need to connect the MIDI `out' of your Atari to the MIDI `in' of the synth. You can then daisy-chain several synths together if you've got. But if so I'm sure you know this already!)

Once you're set up, you'll need some software to read the MIDI file and send the data to your synth. There are many MIDI file players about, check the standard sites (e.g. atari.archive.umich.edu). Alternatively, most sequencers will also load and play MIDI files, as well as ley you view and edit etc. I use Cubase myself, but most others will be cheaper :) - there are a few freeware ones about, again, check the usual sites.

I hope this has been some help and hasn't insulted your intelligence too much :) Feel free to conatact me for further info.

Hi to all,

Does someone know anything about possibillity of expanding an ST with
4Mb EDO (instead of FP) SIMM ?
I tried it and for now it works fine, but I'm worried about long term
complications due to possible bus contention.

Thanks in advance,

Branko

After 36+ Months of Intense Labor our Over Due Baby/Rev. 10 Best
Electronics All Atari Parts/Reference Catalog has Arrived.
This New Rev. 10 version Catalog/Atari Reference Manual is Over 4
Times the size of our last catalog (June 1991) and has Many
Interesting New Features! Just to Tickle your interest here are just
some of the Features: A Catalog Index!, Easy to find Item/Product
format, 55+ Best Technical/Repair Tips covering ST, 8 Bit and 2600 5200/7800
Atari Products, 90+ Best Informative Information Tips, Over 330+ Pictures of Atari
products (last catalog had 137 pictures), Over 2000+ New Atari part Numbers/Products,
Expanded Listing and Descriptions of 8 bit Software Titles, An Atari Memorabilia
Picture Museum and Complete Atari I/O Connector Specifications on just about
every Atari product made! As we start an Unprecedented 15th Year in the Atari
Computer Parts business, Our New fully Computerized Accounting
System has had all of the bugs worked out, so each customer will Now have a
Unique Customer Number for easy Item Inquiries, Order Processing, Invoicing also
we can efficiently Track our 4,000+ Line Item Inventory! The Unique Best
Catalog which is Now Shipped World Wide to Atari end users and Dealers alike, is
priced at $7.50 (Actual Cost to Produce only) (California residents must add
your local 7.25% (.54), 7.375% (.55), 7.50% (.56), 7.75% (.58), 8.25% (.62) or 8.50%
(.64) cents sales tax to the total and $3.00 U.S. Priority Mailing. So if you would
like to get a hold of a Hot off the press copy of our catalog, just
send a check to

2311. VGA and/or RGB Monitors with a 520 ST?

Newsgroup: comp.sys.atari.st.tech

Hey all,

I was just given a 520ST and a 130XE. I was intending to run linux on the 520- until I read the FAQ.. Dang! No FPU.

As you can probably tell I am entirely new to the Atari. I have no monitor for either, but I do have a pc VGA (grayscale- capable of 720x500 under X on my linux box) and a really neat old Commodore 1084 video monitor. Can either one of these be used with my ST? I do not fear the soldering iron and feel like I could cobble up a cord if only I had the pinouts- Unless there is a more sinister contraindication?

Is there a FAQ for the ST series? I would like to give the old fellow some more ram, but I haven't looked inside to see if it will take a simm yet.

Just fiddling with it hooked up to a TV, I was impressed with the graphics- really surprising! The built-in midi is neat too.

If anyone would like my 130 they can have it for shipping. It appears to work great and has a printer and all attendant cables and power supplies, but no disk drive.

d

Gerry O'Rourke (gigxr01@error.com) wrote:
: I am using FreeMiNT 1.2.6 (also tried 1.2.5); MiNTnet 1.01 is
: installed, as is the KGMD package.

That would be FreeMiNT 1.12.6 or 1.12.5.

: I can login fine on the console, & on startup, I see that GETTY is
: running (getty std.9600 is the actual entry).

With a null modem connection you should be able to get much higher speeds
than this (I use 115200), BTW.

: The 'Login:' prompt appears on the PC terminal screen.

: Pressing CR just causes the prompt to be repeated, but any character
: entered before CR causes login to quit with a bus error.

It is normal for the login prompt to appear when CR is pressed, but it is
not normal for login to crash when characters are entered. I have never
observed such a problem.

: I noticed there is a second 'INIT' running.

I believe I always had only one copy of init running on my system.

: Is there any documentation on the whole login process?

When I login on the console, I never notice "login" running, unless it is
started briefly where I don't notice it (monitoring what is running from
another virtual console). What seems to happen is that getty is running
while I type in my name, and then after I enter my name, my shell seems to
start up. If login ran at all, it must have been briefly, and apparently
not while I was entering my login name. This makes it seem strange that
login would crash when you pressed any character, since it seems that
login is not running at that time.

I don't claim to very experienced in this area, however, so I may be
missing something obvious.

The pinouts of the ST monitor can be found at several places. There is a link to them somewhere in the Quick FAQ. VGA pinouts can be found easily with a quick search on Yahoo or Altavista. There are DIY instructions out there.

>Is there a FAQ for the ST series? I would like to give the old fellow

If it's an STE there are simm sockets. Otherwise you'll need an expansion board. There are DIY instructions for this too.

Most of your questions have answers in the Atari ST Quick FAQ. Check out my sig below.

Put the file on a PC 720K disk.
Get midifile player program for the ST (available on most FTP sites).
Put the PC disk in the ST.
Turn on your synth.
Play!

The early models didn't have the Ajax-chip so they're not very reliable with HD-drives. These machines was
shipped with DD-drives. To use HD-drives you *could* just exchange the drives, but HD-mode isn't very
useful... To get it to work properly you'll need to exchange the original 1772-02-02 with an Ajax. The same
applies to early Mega STE's.

For the floppy, I guess you would need an external case and connector to get it working.

As for the ram, they are all DRAM circuits, soldered to the motherboard. I've heard of it being done (by soldering the chips piggyback on the old ones) but it's certainly not a reliable/easy/worthwhile solution.

Can anyone answer this one please? (reply in email for preference)

==========
atari.beta/qna #88, from ataricomputing, 1355 chars, Aug 4 21:36 97

TITLE: SCSI question
From RFS@stjas.demon.co.uk Mon Aug 4 21:04:50 1997
Subject: SCSI links.
From: Richard Stokes <RFS@stjas.demon.co.uk>
Apparently-To: ataricomputing@cix.compulink.co.uk

Many people have told me that it is possible to chain up to 7
devices using the ICD link cable .I have only ever managed to
link 2 successfully,those being the hard drive and the CD Rom.
I would like to add my other hard drive to the equation but
whenever I link it to the others all I get is the drive A and
B icons.I have checked what is on the link using the ICD software
and the third drive never appears.I have set different ID's,I have
terminated the last device in the chain with an external terminator.
I have found that I can link my two hard drives together leaving
out the C.D.Rom but the file selectors on the second drive sometimes
come up as corrupted.The only way I can get my second hard drive to
run is by disconnecting the ICD cable from hard drive 1 and connecting
it up.I'm not too keen to do this too much in case I damage the cable.
Some people have said that short scsi leads are the answer but I have
tried all lengths and with no success! I have never seen an article in
any Atari magazine addressing this problem of adding extra drives to
the system.Have you any suggestions as to what may be the problem?

Richard Stokes

2324. New cheap 040 Atari clone

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-06 00:00:00 UTC
From: Magnus Kollberg <emwoll@emw.ericsson.se>
Message-ID: <33E8811D.446B9B3D@emw.ericsson.se>
Source record: 16209
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I just wonder if anyone has seen that there is going
to be released a new _cheap_ 040 Atari clone this fall.
I found info on it on ST-Computer's web-pages. It looks
very interresting and as I said it's realy cheap compared
to what is available (Medusa040/Hades040).

It features:

68040 @ 33MHz
4 PCI slots
3 ISA slots
4 SIM slots giving a total of 512MB RAM (EDO)
2 IDE slots
Floppy
Realtimeclock
512kb Flash-ROM for easy TOS upgrade
Parallel port
Serial ports

All this with a nice looking case 8MB of RAM, 540MB HD
Graphics card, keyboard and software will only cost 1499 DM!!

ALOT cheaper then the Hades040.

Sounds realy nice.

There will also (where have I heard that before?) be a
Falcon compatible card with a DSP, S-P-DIF interface
and DMA matrix to make it somewhat Falcon compatible.

Take a look at:

http://www.gic.de/st_inside/milan.htm

2325. FS UK Geneva/Neodesk

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-07 00:00:00 UTC
From: rgoring@REMOVEzetnet.co.uk
Message-ID: <5scde2dkm2@irk.zetnet.co.uk>
Source record: 16210

Hi All,

I have Geneva 006 and Neodesk 4.005 (the latest versions) for sale.

Complete with manuals.

Geneva/Neodesk is a multitasking sytem and desktop which will work on any Atari ST, STE, TT, Falcon with 1Mb of RAM.

If you have the RAM you can run several programs at the same time and switch easily between them.

eg. CAB & Everest - when writing HTML pages, means you don't have to unload Everest and load CAB to view the results. Just switch to CAB and hit the 'reload' button.

Geneva rewrites most of the operating system as it loads and allows ALL Ataris to run faster than they would without it.

Neodesk is the desktop which was written to run with Geneva, and they match up perfectly. Interacting with each other as though they were the same program.

Other features -

Have as many ACCs running as you like (no 6 limit).
Load/unload ACCs at any time.
Load/unload programs at any time.
Bomb catching - if a program bombs, geneva will catch it, unload the program and put you back at the desktop - no need to reboot.
Switch resolutions without having to reboot.
Geneva contains a built in file selector which allows ALL disk options from it (copy, move, delete, new folder, etc).
Macros for doing anything from the desktop - eg hitting one key can open up D:\FIRST\SECOND\THIRD\ and display the contents on screen.
Built in icon editor for desktop icons.
Recoverable trashcan.
Clock display.
Printer queue and spooler.
Plus loads more.

Price £40 + £5 p&p

I live near Portsmouth if you want to collect.

Yours Roy

That's o.k, I fixed the problem with a new version of the PC client.
Now I can mount both machine with no problems.

>I get a "kernel error trying to mount device" or something with mine.
>
>Anyone any ideas? I'm using
>mount_nfs -o wsize=512 -o rsize=512 aibs:/c /home/root/c

I use this...

mount_nfs PC:/c /nfs/c

This mounts drive 'C' on host 'PC' under '/nfs' on the Atari side.

Don't forget that you must mount everything through '/nfs'; I don't
think '/home/root/c' will work. I found this in one of the NFS doc files.

I don't bother with the size commands.

This works well, I can access all the files on the PC's C drive.

I also had problems with 'inetd' not starting the nfs daemon, I have to
manually run 'nfsd' & 'mountd' before everything works.

Excelent news. :-))

> I used the serial ports @19200 baud, setup a PPP connection, then
mounted the
> drives. It's not very fast, but it does work.

How about boosting the transfer rate - I'm sure both my Falcon and PC offer
up to 115200 baud, which should be quite a lot faster... I guess the ST might
not go that high, but it should be higher than 19200, shouldn't it?

> I used a null modem cable, but there's no reason why it should not
work over a
> modem link.

Yea, cool...

> I will post details for those interested.

I would be interested in the details - when my ZetNet software is using DUN
properly then I'll be attempting this again myself (at the moment I have a
replacement winsock.dll which screws up DUN, I believe).

2329. 1040ST Wanted to Buy in Tucson, AZ

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-08 00:00:00 UTC
From: Thom Gandet <tgandet@azstarnet.com>
Message-ID: <33EAC66A.5BC680F3@azstarnet.com>
Source record: 16214
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'm in the market for a working 1040ST, with hi-res grayscale monitor. I have several Atari floppy disks that I would like to transfer to my Pentium PC system; unfortunately, the disks were formatted on the 1040.

I need to get these disks into PC format ASAP, but I'd also like to do some experimenting with a 1040 (or Mega) and want to buy an ST or Mega.

If you have a 1040 to sell, or you'd be willing to let me have the use of it for fifteen minutes, and you live in the Tucson area, I'd like to hear from you. Thanks!

Regards,
Thom Gandet

>.

The Link can handle up to 6 devices in my experience. Compatibility between
different devices is a different matter, especially if you are using older
SCSI drives/CD Rom. On my ST with Link, I have 4-40mb Rodime drives in a case
with an OLD Toshiba single speed CD Rom at the end. Even with the drives being
of same manufacture, one refused to work if it was placed anywhere but as the
first drive. Some configurations would result with the following drives partitions
showing up as damaged, and other orders would not let the Link see past a specific
drive. It was very confusing. One particular drive, an older Maxtor, would not work
if another drive at all was in the chain, reguardless the order of the chain.
I went through the whole cable mess, purchased a ton of new connectors and was never
able to just connect the devices in any order as a SCSI chain should be able to.
My advice would be to set up each device independent of the other, and add one
at a time. When you find which one is causing the problem, move it to the front or
rear of the chain and try again. Once you get two working, go to the CD. Typically
I have found that if you get two working together, they should stay together, only
changing which is first if they affect the next device in line (your CD?). It may
be the chain will work if the CD is the first device. You just have to experiment.
Make sure that each drive is supplying termination power to the termline for the
Link. The Link 2 will work with parity, so if it is enabled on one, enable it for all
drives. No parity is ok too.

Mike

2331. ATARI: Bravo Sierra Computers! Hardware, Software, Accessories!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-08 00:00:00 UTC
From: bensmith@kelly.teleport.com
Message-ID: <5selg7$t1v$1@kelly.teleport.com>
Source record: 16216

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SLM 124
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of
Shadow Software. Older Technology made with a lesser chance of Planned
Obsolescence. Built like Tanks. The Shadow tells me each one worked
before they were taken off their Computers. Each one, $25, as is. Model
numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for
Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST
HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may
find something you've been looking for. Something you might want. Even
Something you may of Forgot! At BSC's Web Site you can View, Capture &
even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request
Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why
not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or
Feel free to Request catalogs through E-Mail. Really, it's no inconven-
ience. All I ask is that you specify Atari 8 Bit, Atari ST or both.
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I
will get back to you after the weekend. Please let me know if I can't
attach files to your E-Mail. Please Direct any and all Replies Through
E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in
Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC
Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow
Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer
Platform. Also from The Shadow of Shadow Software (my Boss) a File

called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

There's no such thing as an Atari hi-res greyscale monitor. Hi ST-Hires is
640x400 in monochrome (B&W).

> I need to get these disks into PC format ASAP, but I'd also like to
>do some experimenting with a 1040 (or Mega) and want to buy an ST or
>Mega.

Disk format is partly compatible, so you shouldn't have many problems
converting them if they are in double-sided format (720K). If they are
single-sided disks (360K), maybe an old PC can read them.

>
> If you have a 1040 to sell, or you'd be willing to let me have the

If you can't find a 1040 for sale, you might want to try Pacifist, which is an
ST emulator for the PC. A quick web search should find it.

l> though. Any thoughts on how to get it to load on bootup?

Create a folder APPS inside the AUTO folder and ensure that the #_APP line in
MAGX.INF points to this directory.

This folder will run GEM programs concurrently under Magic (as opposed to
only the TOS programs that can be run from the AUTO folder).

l> Also, is it worth upgrading to 5? Thanks!

If you want compatibility with W95 file systems - long filenames - then yes.
This may be of some relevance with the Net. Otherwise I don't think there's
too much really, although you will get the benefit of some general bugfixes.
It also supports threading in a more similar way to MinT.

Long filenames have a drawback when you continue to use older utilities that
don't appreciate the advances.

That said, v5.11 seems to have some user-relevant improvements...

The WD1772 runs at 8MHz in TTs and other machines with DD disks.

Being that the Jaguar is the only "game" system with a plug in means of device enhancement, doesn't it make sense for someone out there to create a DVD disk player ala JagCD? Perhaps it could add the 56011 DSP chip which has built-in support for Dolby AC-3 Surround Sound. It could have an array of LED Infra-red tranceivers along the front surface to support wireless headphones, 3D glasses, jagpad controllers and more. It seems silly that JTS didn't sell the rights to manufacture Jags to IBM since they were the ones making them for Atari. From the standpoint of potential, the Jaguar seemed to be the most capable. The CatBOX could have allowed for the creation of a "QuickCam-type" camera via the DSP port, a modem could have been connected to the serial port and a WebTV-type net service could have been created. I would have envisioned a feature that would transfer e-mail, RealAudio, and MPEG audio files to be transferred to the Newton 2000 via infra-red to be read or listened to on the way to work. QuickCam support would allowed an easy, relatively inexpensive means of Video Telephony support. Gamers could see each other in a window while playing against each other. People around the world could send video mail to each other's mail box. It truly is a shame that the Jaguar wasn't picked up by someone else. There are 3d-Movies available in VHS format. If we had a JagDVD player and 3D glasses, we would be able to view Imax style movies at home. Play 3D games, etc. and so on. Perhaps if there are enough Jaguars around world wide, it isn't such a bad idea to create the Web browser cart with support for modems through the CatBox. Perhaps CAB can be converted to run on a Jaguar. I guess I rambled on long enough.

Peter Ross

I can't locate my manuals atm, but did you get this from the TT manual? If so I'd expect it to be wrong (Most other manuals were, so why should this be different!).

If you've got Mark's Atari A-Z you'll see in Appendix C that pin 9 is unconnected on Serial 2. This is correct AFAIK. The Atari manuals for this kind of thing have been horrendously wrong on this subject (going by my old MSTe manual).

r>>> Unfortunately I don't have this problem (anyone got a graphics card
r>>> for sale?).
>> Err... me <g> But it doesn't provide all that much over and above

Source record: 16231

Hi Fabrice, on 06 Aug 97 you wrote: ...respect, brethren
f>
f> I want to know if it's possible to put a floppy drive 1.44M on a
f> TT030. If yes, how and what have I to change on hard/software to use
f> it? Thanks a lot

Turn off the machine before opening. Swap the DD drive for the HD drive,
paying careful attention to the orientation of the data cable.

Flip dipswitch 7 on the block underneath the hard drive bay.

That's basically it.

Note:

TOS 3.01 does not support HD floppies.
TOS 3.05 will show an opton for HD floppies in the desktop Format dialog,
but it cannot be selected.
TOS 3.06 supports HD floppies fully.

A replacement OS such as Magic will allow machines with the lower built-in
TOS versions to support HD floppies.

The point about the floppy drive controller (WD1772-02-02) I don't believe is
important. The motherboard of the TT runs at 16MHz, whereas the ST and Mega
STe only run at 8MHz. This being the case, the FDC is likely to support the
increased speed and HD floppies just fine.

I want to do the same upgrade eventually, but I will replace the drive first
before messing around with getting an Ajax chip. It really ought to work AIUI

2347. Do you have ScreenBlaster for Falcon?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-09 00:00:00 UTC
From: atwareck@ece.uwaterloo.ca
Message-ID: <EEnzDp.nzJ@novice.uwaterloo.ca>
Source record: 16232

Hi,

Hopefully if you're reading this post, you have a ScreenBlaster for
your Falcon. I have a few general questions:

1) I know there are four solder points to install the internal version.
However, do _any_ other mods need to be done, i.e. cut traces,
solder in additional wires, etc...

2) What is the range/quantity of pixel clocks? I.e., 50MHz, 80MHz, etc..,

Thx
art

This is James from Boise, Idaho. E-MAIL address jdburr@acpu.com
This is not a difficult problem to solve if you have a friend with an
Atari ST or TT. The difference in the format between those done on IBM
versus Atari machines is that IBM machines format disks with a boot
sector and older STs do not however if you could locate someone with an
Atari or find an Atari users group in you area you need to have them
copy your disks onto a pre-fomatted IBM floppy or format from an Atari
with Diamond Format from Oregon research with the Boot Sector switch
on. Also I have been successful converting my Atari 520 ST from Double
Density to High density using Tos 1.0 and 1.4. If anyone is interested
send me an E-MAIL and I'll send a detailed file containg the hack.

James

2354. TOS Proms that support HD adequately

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-10 00:00:00 UTC
From: Charles Richmond <richmond@plano.net>
Message-ID: <33EE89EE.2DF5@plano.net>
Source record: 16239

I have a 1040 ST and have been using a 40 meg hard disk with it. What version of the TOS ROM's do I need to really support hard disks adequately? The version I have limits me to 256 files per partition. (Although you can *sometimes* add more than that, bad things can happen . . .) I would like to add a 350 meg IDE hard drive and need to be able to add more files than that on each partition.

2355. Lan to serial null modem cable

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-10 00:00:00 UTC
From: bkozlowski@nordnet.fr
Message-ID: <871249106_OASIS_@nordnet.fr>
Source record: 16240

Hello dear all!

I want to connect my Falcon Lan port to my STe Modem1 port. Which cable do I need? Just a standard Mac modem cable (Lan <==> DB9/25), or something like a null modem cable with 2 pins crossed? I went to a Mac shop to ask, but they had no crossed cables and told me it doesn't exist, and you can't link a Mac to an Atari (or PC) serial port... They seemed astonished I could even imagine such a strange thing is possible :-|.

BTW how can I redirect on a Falcon the AUX output to the Lan port with progs not knowing other ports than Modem1, like NOS? And with MiNTnet I guess I just give to pppd the parameter 'Serial2', it's the same thing, right?

Please mail me the reply, I'll summarize for the newsgroup. Followups of this message set to my mailbox.

Thanks in advance! Bruno.

Well I wouldn't pay twice the price for a clone with the same
specs which doesn't even work properly. Maybe they have fixed it now
but there are/were alot of problems with the Hades.

It is not very true. To my mind, it is just a question of time.
Link1 DMA to SCSI adapter use a MACH121 from AMD. It is a small
(small number of logic cells) gate array. It is available for
non professionnal people and its development tool is public
domain (PALASM) (You just have to find somebody who have a
programmer : its the most difficult thing). At the beginning, ICD
adapters were built around four PALs so, it is not a huge system.

2 years ago, I've started to work on a project like that and I
bought a book on the SCSI standard, that was for one part of the
project. Then I tried to find some usefull information on the
DMA port. After that, this interface doesn't seem be to complicated
to built : bidirectionnal inverters on data bus, some glue cells
to drive the control bus but problems may exist. I've made some
schematics (if you're interested in, I can make them available
if I'm able to recover them). I've not make any tests since the
work on my PhD thesis is eating most of my time.

It would be interesting to translate the schematics in order to
put them in a gate array but before that, a board with standard
ICs should be built because in case of problems, debugging would
be easier in that case.

Regards

Jean-Marie.

P.S. Don't try to hack ICD adapter. On early versions, PALs were
not soldered but they had their protection bit set (it prevents
reading of the content of the chip). On interfaces like Link, the
circuit is soldered and it may have its protection bit set. So
trying to hack it is a waste of time.

P.P.S Does anybody have a full description of the DMA port and
protocol (perhaps directly from Atari). Some of my specification
are deductions made using several pieces of information found on
the net.

> solder in additional wires, etc...

Four wires to solder, three of them are extremely simple. The fourth (At the videl) is quite tricky and you
need a good soldering-iron. No traces or wires to cut.

> 2) What is the range/quantity of pixel clocks? I.e., 50MHz, 80MHz, etc..,

ScreenBlaster Inside has a 50MHz clock. It's not compatible with Nemesis though, as it uses the same
control-lines. You have to hack a bit.

OK, Nick!

I tested this .prg, both versions 2.4 & 2.5, but nothing from this
doesn't wonted to work on my Mega4/STe with TOS 2.05 (?!).
I plugged in 8 or may be (don't remember!) 10 (!) mauses from deference
manufacturers to all serial ports (from Modem1 to Serial2), but no one
maus doesn't worked out too.

If your experiments will be more successfully, please, report me about.

At last time, and why coul'd you been to try to reconstructing standard
PC-maus?

Good hunting on mauses!

John - while I haven't tried to make this work myself, I'm told that Flash II works just fine with MagicMac. I do have to ask what version of Flash II you are trying to use though. Early versions (before 2.3) probably would not run properly.

What exactly happens when you try to run either program? Do they boot? If so, I assume they won't communicate with your modem then? If that's the case it's possible that you've got MagicMac configured incorrectly for the Mac's modem.

My 520ST fm with 2 mb expansion memory deveolped a peculiar problem. It will read a floppy directory and put up the icons, but when trying to execute a .prg file, it gives the message "drive a is not responding". Using an external floppy drive, it does the same thing: reads the disk directory, but says "drive b is not responding". Also, if the disk is not write protected, the disk is wiped clean after trying to use it. I have two other STs, and they do not have this problem. I would like to resolve it, as this is my nicest ST. Everyone I have asked about this is as confused as I am. All the chips are well seated on the board.

Friend of mine had built SCSI interface for ST and sold them for cca.
150DM a piece. I know for sure that he picked up schematics and all
needed info from some magazine about atari ST, but can't remember which.
Knowing him, I'm convinced that whole thing wasn't bigger than 4-5 chips
and maybe a few GALs.

I was trying to do exactly that for several years and got stuck on the
same point. Now it seems to me that whole bussiness would be pure waist
of time, given the prices of Link or ICD adapter. Still, it would be
interesting to change DMA chip with something more powerfull to enhance
SCSI througput. Of course to do that, one would have to throw away old
MMU also, and built in something with at least 12 (or better yet 14)Mb
address space and EDO capabillities.

Are you mind reader or what? I did exactly that and gived up at exactly
the same point. I think that today I would crack those PALCEs, but then
I knew too little about them. Anyway, after some time I've got some info
about IDE interface and built for myself (and several friends) PCB with
TOS2.06 & IDE. It works O.K. but is sensitive to the drive model.

While at hardware expansions, does anyone know something about ET4000 expansion? I've downloaded several files on that topics, but none that explains whole principle in english from beginning to the end. I don't have any info about ET4000 behaviour (address ranges etc), expected interfacing (where in address space ST expects to 'see' ET4K) and how to tell TOS "Hey, look! There is another display device! Use it!".
I'm currently drawing turbo card for ST that would be cheap (well, relatively), public accessible as a kit if desired so, with moderate speed-up ratio (expecting 300-600% in most apps.), with dual IDE interface, multiple TOS banks and I hope that I could throw in support for ET4000 and FPU, but at the moment, I have no data about interfacing neither.
Oh yes, one more thing. While looking at various ST-related sites, I've spotted 15Mb RAM expansion card. Manufacturer said that it is TOS2.06 compatible, as it has expanded version of MMU on it with new control register set, arranged to please TOS2.06? Does anyone know something more detailed about that?

Regards,

Branko

I've got both TOS 1.02 and 2.06 on my ST, and I can tell you that
2.06 is a /lot/ faster when accessing files etc on the HD. I'm not
sure what the 256 file limit is due to - my ST's got a huge number of
files on all its partitions, and it works under both 1.02 and 2.06
without problems. Could it be your driver software?

Regarding the IDE hard disk - it's practically impossible (unless you
add all sorts of complicated boards) to attach IDE devices to an ST.
Get a SCSI drive - they may be a little more expensive, but they're
faster and better. :-) It should be possible to chain it to your
current HD, too.

I would rather prefer to spend as much as I can and buy a top of
the line HADES 060. Cheap clones? You get what you pay for!

Yea, the hades is nice. They really need to contract Doug Little and
Dave M. to get some damn drivers wrote for the system. It would be a
heartbeat decission for me if I knew that drivers would become
available regularly.

Mike

2378. Hardware problem (On switching on)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-13 00:00:00 UTC
From: robin@power-x.demon.co.uk
Message-ID: <33f170cd.3336758@firewall>
Source record: 16163

Hello,

Half of the time I turn my Mega STE on the atari logo never appears
and it just hangs with a blank display.

The other half of the time it works fine for anytime between 5mins and
3 hours before it mysteriously bombs out. Turning it off, waiting a
minute and turning it back on results in the computer hanging as
above.

Wait for a long time and you are back to the situation of the computer
working half of the time.

What is going on!

The only conclusion I have is that there is a dry joint somewhere on a
PCB. When the computer gets hot the joint seperates.

If you have any ideas on how to solve the following or you recognise
the fault please let me know.

Thanks,
Robin Grant
robin@power-x.demon.co.uk

> Nobody has see'n a 'milan' or what ever..

As I have said before, it's rather hard to buy something which
hasn't been released yet! They just said that there will be
a new clone presented at the Atari fair in October.

Maybe I wasn't clear on that point, that it hasn't been released
yet. I'm sorry for that.

So why don't you all go and buy that great Hades insteed of saying
that the Milan doesn't excist and the Hades does. The Hades wont
excist much longer if noone buys it! So go out and buy your self
an Hades insteed of complaining about something that "doesn't excist".

Right, i hope we can see that new machine at the next fair in oktober.
I hope !

>Maybe I wasn't clear on that point, that it hasn't been released
>yet. I'm sorry for that.

No Problem .)

>excist much longer if noone buys it! So go out and buy your self
>an Hades insteed of complaining about something that "doesn't excist".

Yep, nobody buys that machine.
That's the problem for the next 'new' machine too..
Any kind of a atari clone needs a lot of commercial spots.
Do have see'n any one?

Only one presentation on a little fair is not enough.
You only can found a handful enthusiasts, that's not enough.

Sure, if that a true real machine and my software collection will work
nice, i buy one.

See me, touch me, buy me.. ;-)
Only in that way.

Regards, Robert

Maybe there is something wrong with the internal floppy.
Some of the control lines are shared with the external drive.

How about removing the internal drive & replacing it with the external one?
(Check it first on one of the other ST's).

You could also try the internal drive in one of your other ST's.

This should validate your drives.

Hello,

I'm in the market for a working 1040ST, with hi-res grayscale monitor. I have several Atari floppy disks that I would like to transfer to my Pentium PC system; unfortunately, the disks were formatted on the 1040.

I need to get these disks into PC format, but I'd also like to do some experimenting with a 1040 (or Mega) and want to buy an ST or Mega.

If you have a 1040 to sell, or you'd be willing to let me have the use of it for fifteen minutes to copy the floppies, and you live in the immediate Tucson area, I'd like to hear from you. Thanks!

Regards,
Thom Gandet

Hi Derryck,

DC> Have you any suggestions as to what may be the problem?
DC> Richard Stokes

My conclusion out of your story is that not the scsi cables are wrong, but you are probably using a bootdriver from ICD, get SCSI Tools 6.14 and a part of the problem is gone...

next (If the first doesn't work properly)

Update your DMA port by putting 1K resistors on pin's 1 to 8 and connecting them all to the +5 voltage on the main board(look around and you'll find it soon enough...

```
pin/data/res. 1 0---888---|
2 1---888---|
3 2---888---|
4 3---888---|
5 4---888---|
6 5---888---|
7 6---888---| 8 7---888---| |
res. value 1k |
|
+5V -----------|
```

Good Luck!

Barry

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. Everything mentioned on this list is on this list
because I have multiples of these Items and I thought I'd list them for
you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. And
Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore
CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives,
Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct
Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM
804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome
Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,
Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk
Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST
and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of
Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space
Eggs, Space Journey Math Educational Software, Target Practice, Temple
of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons &
Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the
Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The
Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World
Championship Karate. Productivity Software for the Classic Atari 8 Bit:
Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak,
Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc.
Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy

Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I

don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

I pulled out my old Atari ST recently after storing it away for years . . .
the disk drive was bad before I retired it, I managed to get it cleaned up
and able to read single sided disks, unfortunately single sided disks ONLY.
I need a new/used working internal disk drive if anyone knows of a computer
store that may have some parts lying around . . . it seems Atari ST stuff is
kind of hard to come by these days.

Hmm, I've not heard that particular problem before although it does
sound vaguely like it might be related to the 40 folder bug. Do you have
FOLDRxxx.prg or an equivilent installed?

PPP yes, you could use Nos (part of Oasis135 package).

I've not heard of XRAS authentification unfortunately so all I can
suggest if nos doesn't work is some unix implementation. I might be
overdoing it though! ;-)

I'd try it with one of the drives out of the working machines. It might also be worth changing the cable from the drive onto the board - it might be damaged.

It sounds like the drive heads are not moving for whatever reason. The spurious writing seems to indicate a hardware problem although iirc write protect is hardware controlled within the drive so the rest of the drive might be ok which is why I suggest changing the internal cable. Unplug the external drive whilst doing all this.

Have you had the drives make a grating or other odd sound before failure? This happened to me when the external drive cable (I later discovered) got damaged (another reason to look at the internal one) - it caused both drives to try shoving the heads past the end of their travel. The grating noise was caused by a cog slipping on its ratchet in one of the drives. It failed soon after. The other, with a different design survived and still works.

If it's black blank then ...

I've had this happen to most all my ST power supplies so it would be
worth looking there first. I can usually reclaim them for a while by
running a soldering iron over the underside. This is faster than trying
to spot the dry joints individually 'cos half the time you cant!

If its white blank then ...

again I've found this to either to be the power supply in the end as
well or the switch on the psu. It could of course be down to other
causes but in my case it never has. The soldering iron trick on the psu
doesn't work here because it's been down to a fried component. The
switch is easily diagnosed by soldering some suitable wires across it.

[I feel obliged to mention]
I'm assuming you know the procedures to avoid getting seriously or
fatally zapped by the psu - if not, don't mess with it yourself.

> If you have any ideas on how to solve the following or you recognise
> the fault please let me know.
>

If it's the black blank problem and the soldering iron trick works then start looking for a replacement psu anyway. It won't last long. Additionally, if you don't wear it out completely you can use it to diagnose the white blank psu problem in the future.

As I posted elsewhere too, the magazine was the c't Magazin fuer Computer Technik
by the Heise Verlag, and the SCSI adaptor was a reader's project in IIRC 1990,
January issue. Go to their web-page (www.heise.de I believe) to find out more,
or mail me.

The ACSI internal connector is

Pin 1 GND Pin 2 D0
3 *RESET 4 D1
5 GND 6 D2
7 GND 8 D3
9 GND 10 D4
11 *ACK 12 D5
13 GND 14 D6
15 GND 16 D7
17 GND 18 *CS
19 A1 20 GND
21 GND 22 R/*W
23 DRQ 24 *INT

> *signal: active low

Here too.

So the extra pins are all additional GND pins. The others are directly
connected to the respective pins of the external 19 pin ACSI connector.

> Source: Atari ST Profibuch

Yep, here too ... ;-)

Cheers Peter

You're looking for a replacement drive mechanism. A PC1.44 drive will do fine, as long as you can change the drive ID on it (which is a disappearing feature on modern drives). There's a file about doing such a mod in the Quick FAQ at:

http://www.geocities.com/MotorCity/2090/quickfaq.html

2411. Disk or software problems with Megafile 20

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-18 00:00:00 UTC
From: ut13@rz.uni-karlsruhe.de
Message-ID: <33f76f566de2ab2@rz.uni-karlsruhe.de>
Source record: 16050

Hello!

I am in a trouble...

Short: There is an unreadable sector on the HD, the programscan't read it, but the Markbad Option in AHDX doesn't findit. That's the thing I don't understand.

Now the details:
I have a Mega 2 ST and MEGAFILE 20.The ST has TOS 1.02 und AHDI. (Yes, I know it is better to upgrade it, but this problem shouldn't appear also now (?))
The program Atari AHDX, version 3.02, doesn't detect any bad sectors. But one fileisn't readable.
I've found this problem ony because a programI had didn't ever work - it used to show 2 bombs (once they were 11).
(BTW 2 bombs appear quite often, somethimes withowt stopping, is that normal?)

Lookuing for the error I tryed to read the file with ST_TOOLS and found out one and the same sector wasn't readable (also as single sector).
(The number was 1880H, Cluster 0C24 or 0C25, on the third partition (E:)). A program I wrote doesn't read it too (wirh Rwabs).

Before a week I had problems with TOS's weird behaviour becauseof lack of disk space (I suppose). But now all seemed to be OK.
I had 540K free on C:, 350 on D:, 31 on E:,,17 on F: (Not too much, but it wasn't a problem before).

Bye

Gentcho

2414. Another ST floppy problem (suspect FDC chip)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-18 00:00:00 UTC
From: la@techprt.co.uk
Message-ID: <33f8144b.6425818@nnrp.cambridge.britain.eu.net>
Source record: 16195

Just recovered my old ST from the attic where it's been for 4 years or so. When it boots, no floppy icons appear - just a blank desktop - but it does try to access the internal drive and also tries an external drive if fitted.

I fitted a high density internal drive and adaptor module just before I put it into storage, after which floppy access was tempramental. Re-reading the info, it warns that not all FDC chips can be successfully double-clocked. Needless to say I don't have the old drive to swap back to.

Are the symptoms I describe consistent with a fried FDC chip?

if (so)
{
Any simple way of checking the FDC? Oscilloscope, DVM, and such like are available.
Suggestions where I might get a replacement FDC (a Western Digital WD1772 or compatible) that IS capable of 16MHz - ideally in the UK?
}
else
Any other ideas what is wrong?

Thanks

Hi Austin,
Get a standard PC-drive - no need to worry about it being 1.44MB - it's
usable anyway.
I believe the best ones to use in your Atari are Sony and Teac, but you
should make sure that it's possible to change the unit number between DS
(drive select) 0 and 1. All PC's use DS1 for both A: and B: and to get it to
be unit 0, they use a twisted cable for the A: drive (so the salesperson
probably won't know what you're talking about). The trick to get it working
is to set the drive to DS0 - otherwise the Atari can't use it, then you
connect the flat ribbon cable upside down (there is a coding pin on the
connector's edge that probably makes it hard to fit, but it should be turned
the "wrong" way). If you try connecting it the wrong way, nothing happens -
only that the drive doesn't stop spinning at start-up - you don't destroy
anything.
You should only turn the ribbon cable the "wrong" way around - NOT the power
(if you do, you'll fry the drive and never get it working).
One thing that might happen is that the drive doesn't recognise that the
disk has been changed, but there is a hardware fix for that - I just can't
remember now. Otherwise, if you do a "force media change" by pressing the
escape key when the A: window is open.
Most Ataris don't have this problem, but some do.
Another thing that's very probable is that you can't use specially formatted
disks - only standard 720kB disks.

Good luck!
Claes

Perhaps what the original poster was noticing is the limit on the number
of files in the *root directory* of a disk. This can actually be set to
just about anything, but some early hard disk formatters used 256. Most
later ones went to 512. Folders can contain any number of items, though if
you start to get too many TOS 1.0 and 1.2 are dog slow at handling the
directories.

Generally speaking, your best bet is to get TOS 1.4. It does not require
any additional hardware changes for a 1040 (unlike 1.6x), and greatly
improves directory access time.

As for using an IDE drive... that I'll let others tackle.

SUBJ: TOS Proms that support HD adequately

Whilst under caution richmond@plano.net said to Officer All :~)

r> I have a 1040 ST and have been using a 40 meg hard disk with it.

Goodo.

r> What version of the TOS ROM's do I need to really support hard
r> disks adequately?

Er!, TOS 206 was supposed to address disk problems and is probably the most
recent Hardware TOS option.

r> The version I have limits me to 256 files per partition. (Although you
r> can *sometimes* add more than that, bad things can happen . . .)

Isnt that just the limit for the root directory, if you create folders in the
root directory to store your info in you'l achieve more files than that.

r> I would like to add a 350 meg IDE hard drive and need to be able to add
r> more files than that on each partition.

Its certainly possible, ive got partitions with files counting in the
thousands, but most are in directories other than the root.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

The chip's generally know as an AJAX. I don't know where to get one but
no doubt someone else can help.

If the FDC is still working you might verify this by dropping back down
to the standard rate to double-check the cause is not elsewhere. There
should be a jumper on the drive which will change it to DD if what I've
read elsewhere is correct.

2421. Formating a SEAGATE 1096 for ST

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-19 00:00:00 UTC
From: Rolf Hemmerling <hemmerling@geocities.com>
Message-ID: <33F9F25A.63753DEF@geocities.com>
Source record: 16056
Cross-posted to: fido.ger.atari,comp.sys.atari.st,comp.sys.atari.st.tech,de.comp.sys.st,fr.comp.sys.atari,maus.sys.atari.hardware,maus.sys.atari.talk,maus.midi,comp.sys.atari.advocacy

I need the low-level format parameters for the Seagate 1096 (83.4
MByte), a SCSI drive, for the ATARI-ST

a) the WINCAP file (or entry for the WINCAP file) for use
with HDX.PRG version 5.04 or newer

b) The parameters needed for the low-level format procedure by
the SED Harddisk editor (by Scheibenkleister, C.Brod)

- Number of heads
- Number of sectors per track (?26)
- Number of tracks
...

In general, I am using the CHBD.SYS harddisk driver by Scheibenkleister
(C.Brod), because it allows both SCSI and MEGAFILE devices to be
connected.

c) Alternatively, is there any site with such informations (for SCSI,
even for RLL or MFM drives) ?

The computer to which the SCSI drive is connected has a DDD harddisc
controller (DDD = Digital Data Deike, Hannover, Germany). So there
is a special format utility.. but we don't own it currently. And we
would like to use CHBD and SED, because of compatibility reasons.

Generally, if I should get other harddisks (from PC), it would be
very interesting to know how to get the necessary parameters, generally.
So if I misguess the parameters.. probably the format (or at least the
partitioning and the copying of the driver) fails.

If You have a collection of new entries for the WINCAP file, I would
be interested anyhow !

If You know any other newsgroup useful for posting such topics, please
tell me.

Sincerely
Rolf

Way cool!
Can you post it on the binary group?

Also, most Atari FTP sites (such as atari.archive.umich.edu) have an incomming folder where you can post the file. They'll usually have a README file directing you of the site's formalities, such as what info to include, and how to go about posting things so you can be more assured the site admin people will post it to the proper place, and make it downloadable by the public. Each site may be a little different in what they wish you to include, but in general it is...

1. A short 1 line description of the file.

2. Notice as to where it should be posted.

3. Info on you, the poster in case they need to contact you about it.

Anyway, check out umich...read the readme files in the atari root directory and any similar files in the incomming directory. It'll be clear as how to post something.

In this case (NFS FAQ or whatever), I'd suggest you have them post it someplace near MINT-NET with a symbolic link to the INFO, and any other "Networking" directories.

I'd love to see how you did it!
And where you found all the necissary bits!

Thanks,
Brian

2427. SCSI-Harddisk problem in CAF

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-20 00:00:00 UTC
From: epkrgdh@epk.ericsson.se
Message-ID: <5te6cn$ohi@newstoo.ericsson.se>
Source record: 16062

I have a problem when recording audio-tracks in CAF after been added
another scsi harddisk.
When I've recorded a track and want to listen to it right after, it sounds
like hell, I mean it sounds as half bitrate and metallic, when I switch
to the other harddisk it sounds great and I switch back and it sounds
shit again. Sometimes when I play the sample it sounds normal and then I
press stop and play again and now it sounds shit again. I have even tried
to run from both drives at the same time and one drive it sounds perfect and the
other shit. I've gone through all the scsi-chain to locate the fault, but
I haven't figured out what, yet.
I have tried to re-format the drive several times and different harddisk-drivers
with no success.

My setup:

cable: computer -> 2 Gb scsi -> 1 Gb scsi -> ez135 -> cd-r -> cd
scsi-id: 7 0 1 2 6 4

2 Gb: Seagate Hawk ST-32155N (the faulty one)
1 Gb: Seagate Hawk ST-31230N
CD-R: Yamaha CD-R 100
CD : Toshiba 520

The last in the scsi-chain has the terminators and I have also tested
to run only the faulty drive (with term on that drive), with no success.
The harddisk itself seems to work in other cases, I have tried to
save normal files to it and it works great then, I have made several
audio/backup cd's using that drive with great success so it is in CAF
it screws.

Any tip?

rgds

Ronny

From: Gene Irwin <girwin@NOSPAM.pstbbs.com>
Message-ID: <33FCFEAD.210B@NOSPAM.pstbbs.com>
Source record: 16072

Probably should have posted this here . . . (OOPS!) <:]
I have a 520ST, drives, monitor, etc.

It seems dead.

I opened it up and someone before me (I got it at a thrift store) had made an attempt to add another 512K to it. But, they didn't finish the job.

Is there somewhere I can get info about how to complete the task?

There are ram chips piggy backed onto the existing chips with a couple of pins lifted and the lifted pins are not connected to anything.

Where do these need to be connected?

Which pins need to be lifted? (need to verify that they did that much right)

Any info would be much appreciated.

Thanks,

Gene.

I'll check it out, but I have to say that umich is not up to date on many
items. It's also very hard to connect to. The 'weekly posting of new stuff' is
very small these days. Do they even have somebody to look after the Atari
stuff ? Mickey Boyd was the last archivist AFAIR.

>
>In this case (NFS FAQ or whatever), I'd suggest you have them post it

Fair enough, although I would not want it to be confused with a generic NFS
FAQ. My file is really for people who want to connect a PC (Win 95) to an
Atari, but since MiNTnet is mostly ported from Unix, it might be enough for
people who are trying to connect a SUN to an Atari.

Hi
Below is a list of what I have for sale.I bought a Falcon so I
don't need my ste.
The highest "reasonable" offer ($US) will get it.I would like to
feel that the purchaser and myself got a fair deal.
Everything is in excellent condition.A new power supply was just
installed in the HD.Buyer pays the shipping costs.I'm in Canada.
In a box and ready to ship!!!

*1040STE/4 megs(language disk and manual)
*60 meg Supra Hard Drive + utilities/manual
*Notator Logic + SL/Log3/Manual
*Atari external DD/DS disk drive
*Atari SC1224 color monitor
*Navarone cartridge clock + disk

Are you running MiNT , or anything else that might take some background time?

It might also be your floppy disks, I found a batch of 3M disks that were
supposed to be HD; I suspect they were DD. they would format with no errors,
but fail to work in both PC's & Mac's. These disks would develop 'amnesia'
after a few minutes. Memorex are sometimes poor also. Forget about Dysan.

I had an intermittent cable problem that also caused problems where the files
on the disk would become corrupted during copy operations.

>I'll buy that (even though it's irritating to think of the wasted money on
>disks that don't work), but.... during formatting everything seems fine
>(and yes, I'm formatting with "verify" on).

>itself (just to be on the safe side).

>
I did try connecting a HD to my STFM, but I used the 16 MHx output from the shifter. It should not make any difference though, the 1772 clock does not have to be phase locked to the CPU clock. I know somebody who belw his shifter when he tapped off the 16 MHz clock.

>I've tried several HD disks, and they all give me the same problem.

>the error message the file has been copied anyway and the file size is the
>same as the original. Not sure if it's working though... (reading from disk
>is sooo slow, I thought I'd ask here before I waste any more time with it).

This is strange, because although I never got my STFM to format without errors, it was able to read PC disks reasonably well. It seemed to be a lot faster than standard DD mode.

>
>Then I opened up a new box of disks and I was able to copy the files
>without any problems.

Can you get somebody to format them on a PC (or a MAC), fill them with files & then try them on the ST?

>And if they are damaged, why no error message when formatting with verify
>on?

They may be poor quality.

>(PS. the disks should be of good quality; "Sony MFD-2HDcf" all of them).

Don't be surprised if even good brands fail. If they are really good, they will have a lifetime warranty on the media.

r> Half of the time I turn my Mega STE on the atari logo never appears
r> and it just hangs with a blank display.

What amount of memory do you have. If its 4 simms i suggest you take out the upper pair, soak test the machine, if there are still problems swap the simms over and soak test again. This sounds like a problem i had when i had memory problems. Do you have any RAM test software??.

r> The only conclusion I have is that there is a dry joint somewhere on a
r> PCB. When the computer gets hot the joint seperates.

It might even be grotty connections on the SIMMS, if after you try the above test, you replace all the simms and its then OK then this would bear out that theory.

From: PWest@fortress.org.uk
Message-ID: <944_PWest@fortress.org.uk>
Source record: 16079

Hi again Branko!

I have for some time been translating the files on the ET4000 project by Thorsten Lang, and have done some of them, but have little free time at present to continue. It's meant for Mega ST's VME bus, but said to be adaptable for other TOS computers as well. One problem is that the design uses a 4-layer board which I am not sure is still available (and making your own 4-layers is difficult, but there could be kludges round this!). It also needs some GALS, though equations are available to blow them.

The up to 15 MB expansions for STs are being marketed by Software Service Seidel and Aixit in the form of the Magnum-ST board (14MB is more usual, the extra 1MB only in some circumstances). I imported one from Aixit for a friend (Derryck, who is active in this topic) and it now works fine (had problems with earlier MagiC versions in accessing floppies, but latest is OK). If you speak german, there is data about it on Aixit's www page.
This has been translated and published on Cix amongst others.

Regards Peter

I had a similar problem with my MSTe a few years ago. The problem wasn't the PSU, but one of the ROM-chips that was just a little bit loose and crashed the machine when it got warm.

Try pressing all socketed chips (And SIMMs) firmly into their sockets, this might cure the problem. If you're lazy you could do the "drop the machine from two feets onto a flat surface"-trick, but the MSTe is quite fragile so I wouldn't recommend that ;-)

Message-ID: <5tn9ak$ie1$1@roch.zetnet.co.uk>
Source record: 16091

Hi,
I'm testing out a batch of floppy drives for use internally on STs. When used on the STFM they work great but they can't format a disk on an STE unless the STE has a drive B connected, in which case they work fine.

My suspicion is that later machines (or TOS versions) address the drive select line in a different fashion to earlier ones. Can anyone elaborate. A friend disagrees and thinks that the timing has changed but only for formatting as reading works fine and writing seems to be OK. Any pointers would be much appreciated.

Regards
Steve Delaney

MP> ST.

Hi there!

There is no such thing as a *dual* two-sided floppy drive for an Atari ST. If you mean one(!) double-sided drive, then, as I've posted elsewhere, almost *any* PC-type DD or HD drive will work (the latter in DD mode only unless you do a hardware mod). You may have to cut away a bit of the case to clear the eject button if you are fitting it internally. Try the Shugart cable both ways round - it's opposite to the PC way on an Atari! And you /may/ have to move one jumper.

If you want to fit an extra /external/ drive, you will also need a case, power supply and special plug/lead. You should be able to get the latter from Best Electronics, 2021 The Almeida, Suite 290, San Jose, CA 95126 (or phone (408) 243-6950 after 1 p.m. local). E-mail bestelec@concentric.net.

Does the Falcon have the full 16 (14) megs of RAM? How about the
clock fix? BTW, Pagestream now sells new for $40.

2463. Brush Script for PGS v2.xx

Should be no problem with a current hard disk driver. There are a lot of
MO users with all kinds of MOs connected to the Atari.

Bill Kapralos wrote:

> There is however plenty of space (I'm only using about about 30 megs)

This doesn't mean anything. Note that (depending on the partition size)
each file allocates multiples of at least 1024 bytes (called a cluster).
So even a file which consists of a single byte will allocate such a
cluster. On large partitions a cluster can be as large as 32768 bytes.

> sectors can be found! I have also re-formatted the drive twice but

This has nothing to do with formatting. It's simply a feature of the FAT
filesystem. Looks as if you need a larger hard disk drive.

Yea, but it's 4+4 (ST Ram/Fast Ram, err, well sort of fast ram:). An
FX, if it can be found, was around $250.00 itself last I checked.
Get an Afterburner:).

For the Atari there is no software available for changing this ZIP drive
parameter. The problem is that IOMEGA refuses to document anything
concerning special features of their drives. Without appropriate
information on how to influence the park time you can't write a program
to change the park time.

Hi Jens, on 25 Aug 97 you wrote: ...respect, brethren
t>
t> I'm thinking about buying a SCSI ZIP drive for my good old TT. My
t> question is if there are any drivers for ZIP drives and is it then
t> possible to use the same disks with a TT and a PC (ie. for data
t> exchange) ?

No problem with HDDriver. I was leant one at the last Atari show to demo
Chris Good's virtual Web and within seconds HDDriver was configured to read
it - no problem. I'd never seen a Zip drive before that day.

Wrt compatibility between Atari and PC for data, I'll leave that question for
someone more knowledgeable...

I have an ICD FA-ST 50 Meg, chained to a Fujitsu 160 Meg, then to a CD player. As of today, the Fujitsu is not accessible. ICD bootup shows the drive there, but doesn't assign any drive letters to it. When I click the desktop icons, it says.."drive doesn't exist". ICD ID prg recognizes the drive, RATEHD.PRG rates its access time (just slightly better than the FAST Quantum), but I can't get at the data I've stored there. Any way short of reformatting, to get at this?

Sounds like its bootsector has gone unreadable. What does ICDFORMAT
say about the partition info. - nothing I bet!

If you can remember the partition info. (start/finish sector etc.) you
can use ICDFMT to "Write Partiton Info Only" which will mend the
bootsector without fiddling with directories and FATs.

Have you got ICD CLEANUP? This often makes a decent job of recovery.

If you can't remember bootsector info. and CLEANUP won't help you will
have to "discover" the start/finish sectors by scanning the disk with
a decent sector editor. If it was formatted with ICDFMT just look
around the approximate places for the string "ICD" as it leaves its
signature in the bootsectors.

2483. STFM & memory above the 4 MByte limit.

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-29 00:00:00 UTC
From: pls@no.spam
Message-ID: <5u6124$71e@bcrkh13.bnr.ca>
Source record: 16118
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

I am posting this to the two groups as it's relevant to both.

I modified a 1/2 MByte STFM to 4 Megs using a 8 MByte 72 pin SIMM.
This works because the 8 MByte SIMM has the same number of address lines as the STFM MMU. It has two more RAS lines, but I just tied these 'high'.

So now I had a 4 MByte STFM & it works really well. I find it's more reliable than my Marpet Xtra ram board

I wondered if there was some way to use the upper 4 MBytes on the SIMM.
I wanted to use the STFM's MMU to access it because it seemed the easiest way (less wiring on the motherboard & it's cheaper).

AFAIK, there is no hardware in the STFM with the address range $400000 to $C000000. Read/writes to this area cause bus errors, generated by the GLUE chip. It's fairly easy to decode all or some of this range, so I decoded an extra 4 MBytes.

Because the ST's MMU only has 2 RAS lines, I expanded these with some more logic & the address decoder to generate a total of 4 RAS lines. It seems possible to generate more, i.e.. 8 MBytes also looks do-able, but all I want right now is the extra 4 MBytes.

So, I built this into the STFM & I can now access memory from $400000 through $7FFFFF. This only works because the memory bank configuration for the 'lower' 4 MBytes is the same as the 'upper' 4 MBytes. In reality, the MMU only really knows about the 'lower' 4 MBytes.

I still have some hardware bugs to iron out, but right away I see some other OS related problems.

I am using TOS 1.04, & it does not appear to like memory above the 4 MByte limit. It sets PHYSTOP to less than 4 MBytes, around 3.2 MBytes.

This may be a consequence of failing the ST's memory test, where $400000 is supposed to be the first unreadable location . I have manually reset this to $400000 & also set the ramtop to $3F8000. When I do the memory test, all 4 MBytes are found.

I have tried a few programs to see if they would detect this extra memory.

Sysinfo finds it , it reports $800000 of ST memory. I though that any memory above $400000 was called TT ram. Sysinfo complains that ST RAM is invalid because it's too high. Sysinfo finds 0 TT RAM.

Memtest also finds the extra memory, it also reports 8 MBytes of ST memory.

Manually setting the ramtop is not really good enough, as the OS still won't use it, so how do you reset all required memory structures so that the extra memory is found? I don't know how to fix this right now.

Also, the screen memory is still set below the 4 MByte limit, the MMU is not able to directly address the 'upper' 4 MBytes. I may be able to fix this later, but I could live with the screen set between $3F8000 & $$00000, as long as the OS can handle two large pools of memory.

I have not tried MiNT, but I was told that MiNT may be able to detect & use this memory right away. Is this true?

AFAIK, TOS 2.06 may be able to address this memory, I remember the Marpet expansion board board (8 MByte extra) needed TOS 2.06.

Has anybody else done anything like this?

2484. WUZTEK RAINBOW MONITOR QUESTION

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-29 00:00:00 UTC
From: Sully <mslaplata@olg.com>
Message-ID: <01bcb41f$9ef6ede0$3680e2cf@pcv-130>
Source record: 16119

I have an aging Rainbow monitor that has outlived my Atari ST days. I would like to use it on an equally aging 486 system. Although it claims to be compatible with IBM platforms, it has a funky non-standard VGA connection, a male DB-25 connector.

Any recommendations on either (1) where I can find an appropriate DB-25 to VGA interface connector? or (2) where I can find any residual Wuztek expertise? or lastly (3) what the connector pin specs might be?

In advance, thank you for the help...

Marty Sullivan
mslaplata@olg.com

Seeing as much of the software from "those days" exists only on CIS and
other such services, is anyone doing anything to protect this?

Maury

Silly me....Thanks to Paul Jones for pointing out the minimum setup
is NOT Colour monitor, that should be Colour "Display" as a Telly will
do as well :)

.

I believe that a lot of the CIS stuff exists at UMICH and also on the
PoolDisk that was produced by Ernest and Bo Schreurs in The Netherlands
about two years ago, but I also see that William Kendrick replied to
your message, so I'm going to look at this reply before commenting
further on UMICH.

For Sale - Atari Falcon 030, Mega STe ++ more
Send inquiries to:
Wm B Mullen Jr<wmbmjr@worldnet.att.net>

01. FALCON 030 Computer w/orig. software:- ATARI WORKS, TRUE PAINT, SPEEDOGDOS etc. $550.00

02. SpeedoGDOS Font Pack (50 scaleable Bitstream Fonts). $12.00

03. Imagecopy 2 (for Falcon True Paint). $10.00

04. Invision Elite version 2. $20.00

05. Pagestream 2.2. $17.00

06. NEODESK 3. $15.00

07. Modem - SUPRA 14.4 EXPRESS (in sealed pkg; not used). $30.00

08. Monitor -PRINCETON Ultra 1400 color (13" diagonal). $145.00

09. 2 - AB Switches (1 for Monitor, 1 for Printer) @ $10 ea. $20.00

10. Atari MEGA STE Computer w/1.5 K floppy drive, (internal) 4 MB Ram w/ Star RAIDERS , TIME BANDIT, & original software. $245.00

11.1200 Modem (speed 1200) w cable. $5.00

12. VIDEOMASTER (copies video) - pllugs in side of STE or Falcon. $49.00

13. UNIVERSAL ITEM SELECTOR. $7.00

14. SPECTRA - runs Mac programs on Atari. $45.00

15. MOUSE MASTER - switches berween joy stick and mouse. $14.00

16. 2 - Joy Sticks @ 6.00. $12.00

17. Trackball. $9.00

18. B - External Floppy Drive & cord (720 K). $19.00

19. Diamond Back II - back-up & restore facility. $10.00.

20. Dr. T"s KCS Omega - music software (requires upgrade to use on Falcon. $24.00

21. MIDISOFT STUDIO & MIDIPLAy (no manual). $12.00

22. The JUGGLER (runs multiple programs). $5.00

23. Paint Programs:- DEGAS ELITE, CANVAS, & SEURAT. $12.00

24. EZ-DRAW. $5.00

25. AEGIS ANIMATOR/ST version 1.2. $5.00

26. CAD 3D version 2.0 & 4 Cyber Programs. $32.00

27. EZ-DATA & MACROMANAGER. $8.00

28. DB MASTER ONE. $5.00

29. GFA DRAFT, ARTIST & COMPANION. $16.00

30. FONTZ version 1.11 (font adaptor). $5.00

31. G PLUS (improved GDOS0. $5.00

32. HAND SCANNER & TOUCH-UP. $48.00

33. MULTI-DESK DELUXE. $9.00

34. KOALA PAD. $14.00

35. INTERLINK Communication Software. $12.00

36. CALLIGRAPHER GOLD version Pr3.03/44- Word Processor w/Labels.
Thesaurus,Grammar Checker, Barcode Production, Automatic Save,
Effects, etc. $30.00

37. WORD-UP version 3, - Word Processor w/many features. $20.00

34. WORDFLAIR II , Word Processor w/many features. $18.00

35. ATARI BOOKS: - ATARI ST BOOK, ATARI ST SUBJECTS, ATARI ST TOPICS
$4/ea. $12.00

No, you can't do that. Amiga mice can be modified to be used on Atari,
but I don't know where you can find the instructions.

There is a serial mouse driver that will allow you to use a PC serial
mouse connected to the ST serial port, but you will not be able to
connect a modem or anything else to it. It's called mouse25 and it's on
umich.

Ah, great joy! I'm so pleased.

This might be a good occasion to remind others to keep a note of their
partiton sector allocations. This sort of fault happens only rarely
but if you have the part. info. you can recover with less grief.

Is this a recent copy of their data? I know umich (?) has a bunch of stuff
from CIS but I know they don't have everything. I remember their being tons
of stuff more when I last used CIS in the 80's. When the new version of 1030
Express came out. In fact, there should be a program of mine up there that
converts version 2 to version 3 phone files.

If you want some help I could lend some time to it. I'm not sure how you
want to do it though. A large tar ball of some stuff would work for me.
(Guess I should get the Unix Atari emulator up and running...)

6.3-named files, if you can believe it.

2500. Epson GT 4000 scanner

Newsgroup: comp.sys.atari.st.tech
Date: 1997-08-30 00:00:00 UTC
From: ingo.marks@t-online.de
Message-ID: <5u97om$q3n$1@news01.btx.dtag.de>
Source record: 16135

A friend of me owns an EPSON GT 4000 SCSI scanner connected
to his TT 030 via an interface to both the parallel
and serial port (the serial port seems to be needed just
for current because there are only two wires).
Recently his scanner failed, and he asked me to have a look
into the interface (at the parallel port).
There is a label "GT*TT Interface 3K Computer Bild" visible on it.
Inside I see a 16 pin integrated circuit with the main
label scratched away (only a part of the rest of it -
SP9108 or SR9I03 or so - is visible).

Does anyone own the same scanner and could have
a look into his interface to tell me the type of the IC ?

Thanks for your reply!
Ingo

I connected it to my TT and the driver (scanx) and scanner work fine.
The vendor sent me an Airborne Express air bill and I can send the
scanner back for one that is in better shape. Hopefully new:).

All is well that ends well.....Except A/B fast ram.

Um, I hope I don't confuse matters with this, but I kind of hate
absolutes :) Actually, there was a dual double-sided floppy for the
Atari ST, it was made specifically for the early 520's.

Is there an English version, or at least some English docs? I would like to
try it out, but hesitate messing with a hard disk driver when I don't know what
I'm doing.

I haven't seen any English docs., Terry. Have you got RUFTRADE? It
might give you enough of a clue about what's going on.

I found the only "dangerous" bits of CBHD were the timing options you
could change with the configurer. I just left them alone - mainly
because I didn't have a clue about what they did!

OK, OK ... something convinced me to grab the files before
they vanish, so I now have all the files from section 11 and
12 of the CI$ ATARICOMPUTING forum, though I have to kludge them
together into one place (section 11 was grabbed with Qmodem at work,
while section 12 was grabbed with Tapcis, a much smarter CI$ aware program).
I will have to write a parsing program to split out the file descriptions
into the individual description for each file that Tapcis does to get them
consistant, but that shouldn't be too much trouble. 1800 files in section 12,
I haven't yet looked into the section 11 stuff yet.

> If yes any reply would be most helpfull

You cannot use it as a standard Atari mouse, but you can use it via the serial port and use a driver such as "genmouse" (which should be on various FTP sites, on the compendium CD it can be found as "files\umich\utils\mouse\mouse25.lzh").

Hope this helps

Anthony

Zhetan (zhetan@aol.com) wrote:
: Is it possible to adapt a mouse for a PC System, to the Atari ST
: If yes any reply would be most helpfull

In the case of a Microsoft compatible serial mouse, simple driver software is all that is required to operate the mouse on an Atari ST machine under the TOS operating system. The mouse will connect to your serial port, and the driver software (for example, Mouse 2.5) will allow the mouse to operate in a manner similar to a usual Atari mouse. If the mouse has three buttons, most software does not support the third button so Mouse 2.5 has options for causing the third button to simulate other actions, such as double click, or shift, control or alternate keys.

The only problem with this is that since the Atari ST series machines include only one serial port, you will find that use of the serial mouse precludes the use of another device requiring this port, for example a modem.

If you are referring to a bus mouse, however, the situation is different. Such a mouse can be used by simply connecting, correctly, a 9 pin D connector onto the mouse. The mouse can then be plugged into the standard mouse connector present in the Atari ST series machines. The mouse will, in such a situation, operate exactly like an Atari mouse, without the need for any additional driver software.

I am unfamiliar with the wiring for the bus mouse, however someone else will no doubt be able to help in this regard. Alternatively, you could search back over the comp.sys.atari.* usenet groups with Deja News, and no doubt a previous article on the subject will turn up.

: use the NVDI driver, which I can only get to work at 360dpi, instead of
: 720dpi.

I don't see what the problem could be with an NVDI driver for it, in fact
I would have thought this would be better since it would then work with
all software, not just Papyrus. Of course it's not very suitable if you
can only get 360DPI, but I am sure this can't be a big problem to avoid.
Perhaps you can contact the author of the driver.

But is this driver for the Epson Stylus Colour 400?
^^^^^^

I am looking for a driver for the Epson Stylus Colour 400, so if this NVDI
driver you have suits this printer, I would be pleased to know from where
you obtained it.

Thanks.

I have contacted both distributors for NVDI and Papyrus and the new NVDI
driver for 720dpi is due out soon. I have upgraded my version of Papyrus to
v5 so that it does background printing with NVDI.

>
>I am looking for a driver for the Epson Stylus Colour 400, so if this NVDI

FREE STUFF IN NORTHERN NEW JERSEY:

Hello All,

I am planning a move into a very small house, leaving the rather large house of my childhood behind. I have several small collections of items which may be of interest to users on this newsgroup. I'm sorry that some of the items are off-topic, but it was much easier for me to make one post to several areas.

If you are interested in picking these items up, please write me an email, fxites@aol.com. I am offerng the items for free, but I certainly would not mind if you felt like making an even trade with any small items that you wish to part with.

Anyhow, here's the stuff:

BASEBALL CARDS...

A small collection of assorted, loose baseball cards, dated between 1987 and 1993. I have not priced each card, but I would estamate that the book value of all the cards would be between $50 and $60. Take them or leave them. If you pick one up, you take them all. Why not? They are FREE!

COMIC BOOKS...

An even smaller collection of comic books, assorted dates. I have several loose, tear-up copies of older comics that were great fun to read, but have no collectable value, as well as two Spawn #1, and the entire Spawn series thru about #20, in addition to other slightly less valuable recent comics. I would estamate that the value of these comics is under $50, but I would really like to hear trade offers for them. If all else fails, I'll let them go for free.

ATARI STUFF...

Many assorted bits and pieces for Atari 8-bit computers, as well as an Atari ST computer with monitor. I was given a very generous collection of Atari items by a member of the Atari Elect this past year. I have had time to figure out which items are of use to me and which are not. I would be happy to see these items go to a good home. If you are in the Northern New Jersey area and can pick up several boxes of stuff before the 23rd of September, they are yours.

STUFF THAT I WANT...

IF you have any carts for the Atari 2600, 7800, 5200, Lynx, Jaguar, or any Atari ST hardware (midi perhaps!?) that you would like to offer in exchange

for any of these items above, please let me know. My first priority is getting all of these wonderful items into a good home, but if I can hook myself up with a few new toys of my own, that would be great.

Please email if you are interested.
-Jon

And the #1 most frequently asked Atari 2600 question is... <drumroll>
"What kind of power adapter do I need for my 2600?"
The answer? 9 volt DC @ 500 mA with a 1/8 inch, possitive-tipped plug!

Your message will be a hard for most to understand, first you say you cant then you say there is a way.

I havent used an ST for years, but i do know there was a mod for a BUS mouse(Not a PS/2) to ST hack and the serial port one you aluded to. so yes there are a few ways to do it. Dont forget the old 8-bit trackball to St mod too

I got a bare-bones 520ST about a year ago, with one boot floppy, no manuals and no HD. Due to the scarcity of help and software, I'm on the verge of selling the system. Can anybody provide me with:

* The most modern OS that will work well on a 520ST. Remember, I don't have a hard drive!

* A decent terminal program so I can get the ST on the net (Zmodem download would be needed).

* Manuals? Any old pro out there who no longer needs to refer to their 520 ST manuals? Even photocopies are welcome.

* Pin-outs and or manual for the color SC1224 Atari monitor.

* Music software for a MIDI keyboard (this is why I got an ST).

Thanks,
Jill

What do you mean with "not ready"? Is there an alert box or something?
What Atari and what TOS version do you have? More details, please.

Somewhere in the distant past I used to play around with an ST....I upgraded it to
1 meg and added a hard drive.....Somewhere I reckon I still have lots of
source code....and probably some games.....I dumped the hard drive (sorry) but
I should have some magazines (ATARi User etc...) I will look them out.

I am in Scotland UK. Tell me where you want the stuff sent (I'll pay postage if it doesn't
cost an arm and a leg).

I can be found at Compuserve 101233,1641
or
witurne@ibm.net

Give me a call

Hello

Quick question for you guys....

Will a Epson Stylus 300 B/W work with the Atari St? I know it can be
used using the Epson LQ mode but what about a driver using NVDI?

Please Email me if you can

Thanks

Richard

Ah, silly me. It has been there all along in the NVDI package.

It claims to support "Epson Stylus Colour" but it does support 720dpi (and
"microweave", whatever that is). So what is different about this new
driver you say is due for release shortly?

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. Everything mentioned on this list is on this list
because I have multiples of these Items and I thought I'd list them for
you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. And
Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore
CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives,
Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct
Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM
804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome
Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,
Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk
Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST
and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of
Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space
Eggs, Space Journey Math Educational Software, Target Practice, Temple
of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons &
Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the
Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The
Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World
Championship Karate. Productivity Software for the Classic Atari 8 Bit:
Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak,
Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc.

Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest

to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

If you downloaded the whole archive (some 200 and a bit kilobytes of LZH)
then you'll find DEFAULT.CFG in the STING folder in the archive, together
with the other stuff that is supposed to go into that folder.

Cheers Peter

2543. Re: AixTT RAM board problems: help!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-05 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <NF4PC2F@tos.pl.net>
Source record: 16028
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I've got my AixTT board going!!

There were, of course, two separate problems - when it did work, only part of the RAM was recognised, and the other problem was that it ceased working entirely when I tried the 32MB SIMMs.

Well the problem where it ceased to work all together must have been a chance problem where the plug was not seated in properly or something. This problem just came right the next time I tried it.

The other problem was caused by the SIMMs I was using not having pins 67 and 68 correctly configured to represent the size of the SIMM. After I connected these two pins correctly, the full amount of memory became available.

Having more memory is a huge improvement after being limited to 8MB. I just can't believe how much easier it is to use the computer when I'm not having to worry about memory shortages all the time.

Also, the new memory is much faster than my old Atari TT RAM board, and the speed increase is definitely noticable in the regular use of the machine.

Now that the board is working, it seems to be going very well. I got a fright when the board stopped working entirely, but it seems that was just a chance problem, these things just happen sometimes. Now that it's working, I have to say I'm very pleased with the results.

Thanks to everyone who helped me with this!

: > This will transform your life :-)
: > Paralink 2000 uses the parallel port on your st/pc/both to achieve

So does ParCP (which I still haven't registered *shame*), and it has a
better name :-) (Don't like the 2000 stuff, makes it sound like something
out of a "What's in Store" ad. Plus it'll be outdated in three years :-)
A bit like Win95 really...)

: > speeds of at least 800kps. We are talking roughly 6 Meg a minute here.

OK, ParCP was _never_ that fast. And it seems to have buggy handshakes as
well, which causes the file transfer to stop without warning in some cases.
This may also be due to a crapish cable, but the protocol should not
just quit on error without retrying...

: What's the difference between this and PARC?

ParCP seems to be a bit slower, but it has more features. Also, ParCP is
Shareware and this program is freeware. And last but not least, ParCP also
works with MinixFS, Win95 and Linux (all with long filenames!), which
definately is a big plus.
Anyway, it sounds worth a try...

Amazing isn't it? That an entire platform's files fits into a ZIP disk....

Is this the A8 files only, or 16bit too? Is this every file uploaded to CIS _ever_, or do they remove old files after some time?

> I would really like to get a single file or three to simplify
> and speed backing up.

Perhaps I can help? I have a ZIPper on my Mac that I find to be much more reliable than the ones on the PC, notably on large files like this.

Maury

Hello,

Please could anyone tell me whether a French Atari Company, OXO Concept is
still in Business?
I have enquired from their web site [http://www.oxo.ch/default.html],
but have had no reply.
There seems to be some really good products here.
Does anyone know of them?

Interested to find out!

Regards, Dave.

h: comp.sys.atari.st.tech,comp.sys.atari.advocacy,comp.sys.
h: atari.programmer,com p.sys.atari.st Subject: New ST
h: User Needs Help! Organization: SUNY Utica/Rome

h: I got a bare-bones 520ST about a year ago, with one
h: boot floppy, no manuals and no HD. Due to the scarcity
h: of help and software, I'm on the verge of selling the
h: system. Can anybody provide me with:
h: * The most modern OS that will work well on a 520ST.
h: Remember, I don't have a hard drive!

Without a hard drive there is no point on loading a new OS
(such as Magic, MinT), however you can load something like
NeoDesk, or other desktops BUT on a half meg ST, it's
really not worth it!

h: * A decent terminal program so I can get the ST on the
h: net (Zmodem download would be needed).

with only half a meg of RAM? umm, I don't think so.
upgrade your memory, or purchase (very inexpensively) an
STe if you can find one.

h: * Manuals? Any old pro out there who no longer needs
h: to refer to their 520 ST manuals? Even photocopies are
h: welcome.

I could send you a photocopy of the manual, but it would
probably make more sense to download (if possible) Nicholas
Bates ST FAQ.

h: * Pin-outs and or manual for the color SC1224 Atari h:
monitor.

If you want to use the colour monitor for some other
system, it is not capable of the scan rates needed for
other systems (with the possible exception of the Amiga -
I don't know)
The pinouts are:
1 audio out
2 composite sync
3 general purpose output
4 monochrome detect

5 audio in
6 green
7 red
8 +12 vdc for peritel devices
9 horiz sync
10 blue
11 monochrom
12 vertical sync
13 ground

h: * Music software for a MIDI keyboard (this is why I got
h: an ST).

1)Notator
2)cubase
3)Dr. T
4) ?...

h: Thanks, Jill

good luck.bonne chance

A8 only .. libs 11 and 12 ... plus the St Transformer files from lib 5.
If I dig out an ancient CI$ listing from the old 8 bit forum, I should
have an idea if things were deleted .. I suspect yes, but perhaps someone
more active in the CI$ forums would know now.

Did, done .. single Pkzip file .. 24 megs or so. Pkzip bombed on my
system (choked perhaps) possibly due to my own system memory constrants,
but the file was there deleted, so I undeleted it and it looks valid
(passes the Pkzip -t).

2552. Sony SMO-F331 MO drive

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-06 00:00:00 UTC
From: Dan Phillips <xiting@worldnet.att.net>
Message-ID: <3411C84C.679@worldnet.att.net>
Source record: 16037

Well, I've tried the SMO-F331 on the Falcon and HD Driver 4.52 doesn't

even seem to see the drive at all. If I run RATEHD, I get a rating for the MO, even if the cart is 512 byte DOS formatted. BIGDOS v0.8 doesn't gain me access, either. ICDBOOT sees the drive, but it seems even with BIGDOS, it will only read an Atari partitioned cart. I really want to be able to carry data back at forth between PC and Falcon on a cart.

The MO is set as SCSI 6.0 and I set HDDriver to look for it. ICDBOOT sees it at 6. Ahead of the MO is a Quantum 340 at 2, a Quantum 105 at 3, and an NEC 3Xe CD-Rom drive at 5. Ultimately, I will add my Floptical back in at 4.

Also, is there any way for me to damage my drive data if I let BIGDOS write DOS-compatible info as it prompts me to do every time I access an Atari partition?

Thanks for any help,

Dan

2553. NEEDED: Atari Mega 4 ST! Willing to Trade(USA)!

>

Don't be silly ;-) We all try to be very helpful, and there is plenty of
software on the net!

> * The most modern OS that will work well on a 520ST. Remember, I don't
> have a hard drive!

Remember, the OS is in ROM, so upgrading TOS means replacing the ROM
chips. The latest version that will work on your ST is 2.06. There are
upgrade boards available that allow you to switch between the original
TOS and the new one, which is useful for compatibility with older games.

Without a HD, and with only 512K of RAM, I would forget about MagiC,
Geneva, Mint, etc... which are modern multitasking systems.

>
> * A decent terminal program so I can get the ST on the net (Zmodem
> download would be needed).

There are several ZModem capable terminal programs (I'm not a
specialist, but take a look at a few FTP sites), TCP/IP PPP and SLIP
connection is now available with STinG, Web browsing can be done with
CAB (you'll need at least a meg though), Usenet and email and FTP can be
done with Newsie... There is other stuff too.

>
> * Manuals? Any old pro out there who no longer needs to refer to their
> 520 ST manuals? Even photocopies are welcome.

The manuals won't tell you more than how to copy a file, format a disk
and save the desktop. I'm sure you can figure that sort of stuff on your
own. There's a chapter about that in the Quick FAQ (see below).

>
> * Pin-outs and or manual for the color SC1224 Atari monitor.

Pinouts can be found here:

http://www.teleport.com/~atari/STinternals.htm#MONITORPORT

>
> * Music software for a MIDI keyboard (this is why I got an ST).
>

Just like on other platforms, the best ones are commercial, Cubase,
Notator, Logic... you often see people selling second hand copies on
this group.

Otherwise, Alchemie or Sweet Sixteen are shareware seqencers that can be
found on the net. I don't have the exact addresses, but they can be
found.

> Thanks,
> Jill

I suggest you take a serious look at my Quick FAQ (the address is in my
.sig). The ST can probably fulfill most of your needs. Don't give up!

I'll see what I can dig up and email them to you - however, since my hard disks died, that means I will have to go through about 1,200 floppies - might take a little while :)

You might want to check out some ftp sites

for example, the umich atari archive, one of the directories has "fontgdos" in it (I believe it's the /Printing/ directory) - I've also seen some SLM drivers for 1st word, but I can't remember where.

From: dh219@cam.ac.uk
Message-ID: <5uuekihhf1@roch.zetnet.co.uk>
Source record: 16042

Hi All,

I was recommended MUTT mailer 0.81 for MiNT to get my mail from a pop3 server - but I don't know how to get it to put my correct email address in the from: line. Anyone help?

Also: i have a 4 Mbyte system - after running it a couple of times, the system refuses to run anything else (but the most basic utils) due to lack of memory. But over 1000K registers as free. Is Mutt stealing memory when it exits?

And: Whenever it downloads POP3 mail, if my local mailbox is not empty - it crashes out with "Mailbox Corrupted". Any suggestions there?

Flinny recommended fetchpop as an alternative, is there a mint binary version available anywhere as it refuses to compile complaining of certain undefined functions all in socket.c.

I'm a MiNT newcomer, so if I'm missing something obvious do please help me out as well!!

Cheers,

yours etc.

David.

Probably not, I guess it's just fragmentation.

> And: Whenever it downloads POP3 mail, if my local mailbox is not empty -

Hmm, I never experienced this. Do you use any other mailreaders that might
screw up your mailbox?

> Flinny recommended fetchpop as an alternative, is there a mint binary
> version available anywhere as it refuses to compile complaining of certain
> undefined functions all in socket.c.

I use a package called 'pop3', if found the archive (with binaries and everything)
on ftp.fu-berlin.de. It's called 'pop3.1.1.tgz'. It was really easy to set up and
works perfectly, but you must have a mail delivery program installed (Like smail).
If you're using KGMD this should already be installed.

There are some hints on how to set up smail for offline-use in the mutt-docs, you
should read those.

Any good SCSI-drive should work, but the SCSI-interface in the MSTe is a
bit peculiar, so there are a couple of things you'll have to be aware of:

1. It doesn't support parity-checking, which means that you have to find a
drive where you can turn this off with a jumper. Alternatively you can
hook the drive up to a PC, Mac or Falcon and turn parity off with
software.

An alternative is to build a parity-generator yourself, this is very easy
if you're a bit handy. There is some info on this on my Atari-page:

http://www.stud.ntnu.no/~josk/atari/

2. Termination... According to the SCSI-standard the first and last device
in the SCSI-chain should be terminated. Not so on the MSTe, you have to
turn off termination (Either by removing a jumper or removing the
resistor-packs near the SCSI-port.) on the drive.

3. I'm not 100% sure about this (I sold my MSTe in '94), but I believe
you have to set the SCSI ID on the drive to 0, otherwise the SCSI-adapter
in the MSTe won't find it.

If you can find an older Quantum 540, those work very well in the ST(e)'s.
Actually most the newer SCSI drives will work, but as you mentioned, you might
find a few that have compatibility problems. Newer Quantums come to mind.

I have a Segate Hawk 1.06gb, a Fujitsu 2.5gb,a Maxtor 340,and a couple of Quantum
540's. Some of these are older drives that you might not be able to find any longer.

You might have to upgrade your disk driver with some of the larger drives, but AHDI
or ICD should be fine with the smaller ones.

I'm sure there are many more to add to the list.

Mike

Sergei Kokoushkin has just done this job with his Mega STe - he is a
musician too!

Almost any drive would do which will fit the space available - he used
a Seagate 5660N (550Mb).

You need to format the zip disks on the IBM and if you dont have some sort of special driver on the atari that allows you to read large IBM partitions, youll need to partition the zip disk on the IBM in 32 megabyte partitions for a total of 3

No, I'm trying to read single sided disks...the drive is belt driven (I've
opened it up and looked at it). I wonder if the belt is slipping? It's
trying to grab but can't and the computer interprets this as the drive not
responding...

Dan Phillips (xiting@worldnet.att.net) wrote:
: even seem to see the drive at all. If I run RATEHD, I get a rating for
: the MO, even if the cart is 512 byte DOS formatted. BIGDOS v0.8 doesn't
: gain me access, either. ICDBOOT sees the drive, but it seems even with
: BIGDOS, it will only read an Atari partitioned cart. I really want to be
: able to carry data back at forth between PC and Falcon on a cart.

I don't know about your particular MO drive, but I had no problem accessing the same disc on both the TOS machine and the DOS PC. The only difficulty was that the disc had to be partitioned in a certain way on the PC for this to work. IIRC, there is the possibility of creating physical, logical, extended and all kinds of partitions in DOS; only a certain type seemed to be suitable. Note I am not familiar with DOS and this was discovered only be experimentation.

: Also, is there any way for me to damage my drive data if I let BIGDOS
: write DOS-compatible info as it prompts me to do every time I access an
: Atari partition?

I never damaged data this way, but somehow the warning kept appearing even after I had told it to change the incorrect information. In the end I just disabled the option in BIGDOS that reports these errors.

From: Stephen Barrett <sbarrett@indigo.ie>
Message-ID: <01bcbcb0$bc045dc0$3e947dc2@default>
Source record: 15963

Is it possible to use a tos image from one Atari (v2.06) on another Atari.
I know that the early St's used a disk based tos and I was wondering if it
is possible to load the new tos vesion on top of the old from disk. I have
tried using an auto folder (some chance ;-)) without success. Any help
will be greatly appreciated.

Afraid not :-(The only practical solution to this is to use a technique
called "paging", but you need a proper MMU (I.e. a 68030 or better) to do
this. MiNT 1.14.x might be the answer, if you own a TT that is ;-)

This is a multi-part message in MIME format.
--------------CE0202D72EDD6B4A4D908FF6
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

Hello all,

I've been ignoring my Falcon for a few years now, but I'd like to put it
all back together so I can use it to program my Jaguar :-))

I've sort of got used to my SGI now, so what I thought I'd do would be
to link the two machines together with MiNT-net (or Fenix, when it
becomes
available) so that I can program in the relative comfort of Irix, and
download onto the Jaguar from the Falcon.

I've set up a serial line between the two machines, and with terminal
software, I can log into the SG from the Falcon at 38400 baud, using
Connect. So far, so good. I've also set up SLIP on the SGI in the
standard
way, so that you log in as 'slip', give a password, and the SGI says
'starting SLIP' then you have a SLIP connection active. What I don't
seem to be able to do is get the SLIP connection to work when inside
MiNT.

I've tried the slattach stuff, but figured out I needed dip. I
configured
dip, and it just hangs. I'm using the device /dev/modem2, which at least
responds with garbage when I use minicom to talk to the SGI.

(garbage: it returns a few random characters after I press return - I
assume
this is the 'login:' prompt from the SGI, after it's been munged
somehow)

So, I think I'm using the correct device, I think I have the correct
software (dip), and I think the line works ok. The only thing I can
think of is that
the MiNT drivers can't handle 38400 baud.

I seem to remember that ST's (Falcons too ?) couldn't drive the serial
hardware at high baud rates... Is this my problem ? And if so, how do
people use modern modems ? Certainly Connect has no problems, or is this
just clever programming on Connect's part ?
```

I looked through the version of MiNT's tty.c, and it seems to indicate
the
serial lines can go as high as 230kbaud (wow!), but maybe it needs a
.xdd
driver...

Any help gratefully appreciated.

ATB,
Simon.

Most of the good MIDI stuff needs 1 meg to run. Also you need the SM124
mono monitor for most of them. Chances are the TOS in your 520 is the
dreaded 1.0, and that the floppy drive is only single sided.

best of luck with it.

It can be found on the lip6 (ex-ibp, ex-cnam) FTP site at:

ftp://ftp.lip6.fr/pub/atari/telecomm/ghostlnk.zip

beware, this FTP is quite picky with passive connections. It's better to
use a proper FTP client to access it.

2587. Falcon = Midi Expander Project

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-09 00:00:00 UTC
From: Stephane LANDIER <slandier@icon.co.za>
Message-ID: <3414FE8A.932654F3@icon.co.za>
Source record: 15972
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.st

Considering the amazing Features of the Falcon for music, I think it would be a nice idea to write a software that would turn the Falcon into a fully fledge midi expander. Some kind of "EMULATOR III". As most falcon have a hard drive & at least 4megs of memory, it could be an interesting machine, and I am sure the dsp can at least compute 8 16bit tracks in real time.
Also, I woudl be great to be able to load the Soundfonts that are used by the AWE32/64 sound board

If anybody is interested by this project, please send me an Email. I would be most willing to go back to Machine Code programming myself, but I have no knowledge of DSP coding, so any help in that field would be immensely appreciated.

Please give me some feedback !

Thanks,
Steph

>notice the

It shouldn't crash because of lack of memory.MS-DOS programmes must ask the OS
to use memory.It's up to MS-DOS to tell it where the free memory is.
Actually,this is how the Atari works too.
PKZIP should just get a error from MS-DOS and exit.And PKZIP (2.04g) uses XMS
memory.(and EMS,but nobody uses that anymore)

How much MS-DOS and XMS memory do you have?

Try replacing the main transistor(IC?) in its power supply.
I have seen that many times in switching power supplys. When beta of
main transistor fails below certain point, PSU won't start, but when it
starts (or when you start it manually by feeding its output from other
source for a moment), it works more or less O.K. If you leave it that
way it will eventually stop working completely and in some cases will
say "BOOM!"

Regards,

Branko

Hi stephen
yes: it is possible. all you need is a PRG to start the TOS.IMG and
if you use 2.06 as diskloaded TOS better more than 1 MB of RAM. it takes
260Kb
or so. The TOS 1.0 from disk was started by a little bootsector program
that's
why you can't see what starts the TOS.IMG there. No chance to start
without!

Message-ID: <5v4a0h$1lf0@r02n01.cac.psu.edu>
Source record: 15981

Hi folks, I recently acquired an Atari SM124, and I've noticed two things about it (HA, hard not to notice!). They are:

1. There's a good 1.5" chunk of blank screen at the top and bottom of the screen, and about an inch on either side.

2. I've already asked 4 different people, and we can't tell...

...but the desktop looks crooked on the monitor every now and then. Some people see it, some don't.

Are any of these things normal, or are they problems that can be fixed? I figure the crooked desktop image could be fixed by a tv repairman??

Thanks,

Ken Williams

That's normal. There's a hardware modification to enlarge the image to
fit the full screen. It can be found on several FTP sites.

Wait for 1.14.5, perhaps the bugs are ironed out then :-) The current
version (1.14.4) works on Falcons with a little patch installed.

Hello,

From today, you can find my web site at this completely new URL
address:

****
* http://ping4.ping.be/dipching-drulkhor/INDEX-E.HTM *
****

The old address will stay valid until the first October 1997 ...

http://www.ping.be/~pin10575/INDEX-E.HTM

Nevertheless, to avoid any confusion, I will ask you to edit your
bookmarks now ... and be sure to find my whole site already functional
THANK YOU VERY MUCH

Note 1: my e-mail address stay THE SAME : dipching@ping.be

Note 2: for those frequently using THE ULTIMATE T.O.S SOFTWARE INDEX,
it's now necessary to use the following address:

****
* http://ping4.ping.be/dipching-drulkhor/PRG-IND.HTM *
****

Note 3: if you have any link about me on your web pages, could you
please edit it to make sure that everybody will continue to find the
right way to the dipching ... ;-)

Sincerely yours

Jo

Normal. Not only is Overscan acailable, but you can adjust a couple of pots inside to stretch the existing 640X400 to near full screen. I believe that this will accelerate the failure of a weak link in the monitor design, however, so that mod should be performed first.

> 2. I've already asked 4 different people, and we can't tell...
>
> ...but the desktop looks crooked on the monitor every now

Anyone who knows how to handle _high_ voltage should be able to twist the yoke on the picture tube a little to get the screen straight. Usually you have to break loose the glue holding it in place, then reapply hot glue to hold it. Do _not_ attempt unless you know what you're doing. Several thousand volts will more than curl your hair.

Read it again. :-)

The VM module in MiNT 1.14.x is currently rather unstable on the Falcon,
but works OK on TT's...

What to do? RTFM? :-) (rename to MINT[np].PRG and set up the swap partition,
I think)

After several months my AixTT RAM board has finally arrived, amazingly.

However, I'm having some trouble getting it to work, and hopefully someone more experienced with this board or such devices in general can help me.

After receiving the board, I unpacked it from its static bag and connected it into the TT's TT RAM connector (in place of my old Atari 4MB SIPP board). I then put two 4MB 72pin SIMMs into the AixTT RAM board and switched on the TT.

When the memory test appeared, all the memory tested ok, but only 4MB of memory was listed, even though I had put in two 4MB SIMMs (total 8MB).

I tried both jumper settings, but this made no difference.

I then tried two 32MB SIMMs, but these showed somewhat different symptoms. The memory test went ok for the first half, but the second half came up all X's, indicating that the memory did not test ok. Also, the second half of the memory test bar appeared very quickly compared to the first half. Only 16MB of memory was listed at the end of the memory test, even though I had put in 64MB of memory (two 32MB SIMMs).

Now the situation is worse, however: after I tried those 32MB SIMMs, the board no longer works at all! No matter what SIMMs I put in, the memory test completely skips the TT RAM now, as though no TT RAM at all is installed. It would appear that, at that point, the AixTT RAM board must have got damaged.

I have since come to know that there are PS2 SIMMs, which are different to other SIMMs in that they consist of only one bank. It seems that the SIMMs I was using were not PS2 SIMMs.

While Aixit told me that any 72pin SIMMs would be suitable for the AixTT RAM board, I notice that the documentation supplied repeatedly refers to PS2 SIMMs, although since the documentation is in German I can't determine exactly what it says (since I don't understand the German language).

So: does the board really work with any 72 pin SIMM, or is it only PS2 SIMMs that are compatible with the board?

If the board only works with PS2 SIMMs, would the board have become damaged as a result of trying non-PS2 SIMMs?

What can I do now?

Of course I mailed Aixit about it, but if they are as hopelessly slow at responding and as unhelpful as they have been in the past, I think I might not get very far with this. So I hope some other user of the board is able to help me.

Any assistance with this problem would be much appreciated.

(Although I regularly read this newsgroup, I would appreciate it if replies could be sent by email as well as to c.s.a.s.t. since I sometimes miss replies otherwise. I will be sure to post a summary to the group once (if) I get the problem sorted out.)

2605. Highest TOS version in an STFM (without hardware mods)?

Newsgroup: comp.sys.atari.st.tech

From: "John 'john..' Tuffen" <jat5@york.ac.uk>
Message-ID: <3416BE3E.41C6@york.ac.uk>
Source record: 15899

Hi,
I really think that I should upgrade my STFM from TOS 1.02 to something higher. What is the highest TOS version that I can go for (without making any modifications to circuitry etc.) I seem to remember that it is TOS1.04 (1.06 & 1.6 being for the STE). Is that correct?

cheers

john..

As it turned out, Mario's board was simply not seated correctly
onto its socket. It now works perfectly and Mario is a happy camper!

For those who need English docs, I have scanned the translation
of the AixTT docs produced by Computer Direct as a 16-color GIF.
It will be uploaded to my page, as soon as Chris Krowchuck gives
me permission to copy their stuff.

Check my "TT030 Homepage" section regularly for updates about this.

Almost certainly the power supply.

Swampdog's tecchie guide to failing psu's ... ;-)

Ticking = dry solder joint.

Crackling = worn out on/off switch.

Almost all of my (ST) supplies have died from ticking, you can usually hear it at odd times before it dies properly. The good news is running a soldering iron around will usually bring it back to life. The bad news is it only works for a while.

The other few times except once, I've had the crackling syndrome. Soldering jumpers across the switch diagnoses this.

The one other time? Dunno the supply just stopped working and I don't have the equipment to diagnose it.

... end of tecchire guide.

[
Obligatory warning. Don't mess with it unless you know the dangers concerning such power supplies - they can bite!

Yes. 1.04 cures most bugs and, particularly, gets the HD system right.

Before you get the ROMs, though, consider this ....

You could get a second-hand MagiC v2 for around the same price. Your
1.02 ROMs would just get used to load it - after that you have a
bug-fixed, multi-tasking OS. You would lose about 300kb of RAM, of
course, but maybe you could tolerate this. Or perhaps you are thinking
about upgrading RAM anyway?

No, this is absolutely wrong. There is no size limit at all for TT and
Falcon IDE/EIDE and SCSI hard disk. Note, however, that AHDI is not able
of supporting SCSI disks > 1 GByte. You have to use another hard disk
driver than AHDI.

2618. MiNT and (relatively) high baud rates

Newsgroup: comp.sys.atari.st.tech

Content-Transfer-Encoding: 7bit

(Reposted, because I put it into the wrong place :-(

Hello all,

I've been ignoring my Falcon for a few years now, but I'd like to put it
all back together so I can use it to program my Jaguar :-))

I've sort of got used to my SGI now, so what I thought I'd do would be
to link the two machines together with MiNT-net (or Fenix, when it
becomes available) so that I can program in the relative comfort of
Irix, and download onto the Jaguar from the Falcon.

I've set up a serial line between the two machines, and with terminal
software, I can log into the SG from the Falcon at 38400 baud, using
Connect. So far, so good. I've also set up SLIP on the SGI in the
standard way, so that you log in as 'slip', give a password, and the
SGI says 'starting SLIP' then you have a SLIP connection active. What
I don't seem to be able to do is get the SLIP connection to work when
inside MiNT.

I've tried the slattach stuff, but figured out I needed dip. I
configured dip, and it just hangs. I'm using the device /dev/modem2,
which at least responds with garbage when I use minicom to talk to
the SGI.

(garbage: it returns a few random characters after I press return - I
assume this is the 'login:' prompt from the SGI, after it's been munged
somehow)

So, I think I'm using the correct device, I think I have the correct
software (dip), and I think the line works ok. The only thing I can
think of is that the MiNT drivers can't handle 38400 baud.

I seem to remember that ST's (Falcons too ?) couldn't drive the serial
hardware at high baud rates... Is this my problem ? And if so, how do
people use modern modems ? Certainly Connect has no problems, or is this
just clever programming on Connect's part ?

I looked through the version of MiNT's tty.c, and it seems to indicate
the serial lines can go as high as 230kbaud (wow!), but maybe it needs a
.xdd driver...
```

Any help gratefully appreciated.

ATB,
Simon.

Hi,

I'm about to buy a new hard disk for my Atari Falcon030. Are there any
hard disk brands/models I should avoid? I'm thinking of buying a Quantum
Fireball ST 2160Mb Ultra-SCSI, would it work?

> I figure the crooked desktop image could be fixed by a tv repairman??

The SM124 leaves the factory with a small display area:

1. To avoid edge distortion.
2. To avoid over stressing a bipolar capacitor in the line scan
circuit.

If you can tolerate a bit of edge distortion you can cure 2. by
tweaking HEIGHT and WIDTH pre-sets on the PCB. HOWEVER ... if you
don't also replace the dodgy bipolar at the same time you may get a
breakdown later.

The display being skew-wiff can be cured by fiddling with the trimming
magnets on the connector end of the tube.

Usual caveat .... don't do this if you are not confident with high
voltage electronics!!

Wierd - I'm sure the version I downloaded had a readme.txt or something
which gave an indication of how to install it (I could be wrong though)...

> better try and find it somewhere. Berlin perhaps....

I'd try sven's pages - they have moved, but they are still linked to from
his old pages at: http://www.efd.lth.se/~f92sk/fenix.html
(I really ought to update my links...). The notes on these pages refer to
pl0, but there shouldn't be any changes of how to setup...

Anthony

2630. VLB on Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-12 00:00:00 UTC
From: lynxpro@aol.com
Message-ID: <19970912092301.FAA07007@ladder01.news.aol.com>
Source record: 15915

I posted this on the other section, but I thought I would cover all my bases.

My question. I've seen text files on modifying ST's with VLB VGA cards. I am wondering if this can be done to the Falcon too. Sure, the Falcon already has VGA graphics, but they are slow and eat up main memory to generate them. That sucks. So, my question is, can you modify a Falcon to use a VLB card? (let alone are there any drivers...) That seems like it would be a better alternative than using something like Blow Up or Screenblaster.

Thanks.

Jeremy

2631. Re: SM124 Problem? ...or is it normal?

Newsgroup: comp.sys.atari.st.tech

Message-ID: <5val3o$48p$1@opera.iinet.net.au>
Source record: 15916

I have adjusted two or three monitors to enlarge the display.It is quite simple but there are two negatives !
Don't put your hand in the back of a monitor unless you know exactly what you are doing (you can still get fried even if it is turned off) !
I read in a FAQ somewhere that it reduces the life of the monitor by increasing the load on a weak component (design fault).
If you stll wish to proceed I will E.Mail the FAQ to you (when I find it)

Regards,

Bill

2632. New Lower Prices! Atari!

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4. (2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs or E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an order of enough of my stock. One example, a customer ordered over $200 of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125 Mono Monitor with a Built in Monitor stand and an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive plus a modified 800xl with a built in Translator on a switch that will run older Software without a Translator Disk Plus Lots more new 8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

|> date changes in 2000?

Not necessarily. The GEMDOS keeps the date in MSDOS format, which is good
enough until 1980+127=2107. But of course, the software may already break
down before.

2635. Looking for '030 upgrade for STe (UK)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-12 00:00:00 UTC
From: cpb4@ukc.ac.uk
Message-ID: <348@ash.ukc.ac.uk>
Source record: 15920
Cross-posted to: comp.os.linux.m68k,comp.sys.atari.st.tech

(I appologise if these are not the right newsgroups to post to.)

I currently have a 520 STe with 4Mbytes of RAM and a SCSI hard disk
connected via an ICD "The Link". I want to upgrade this sufficiently
to run Linux/m68k on it (specifically, Debian, as I'm already
developing for Debian on i386).

I gather that all I'll need to upgrade is the processor, and that I'll
need a 68030 with FPU. I take it the rest of the system (memory etc.)
will work with the new processor? Can anyone tell me what 68030
upgrades are around, and where I can get one of these in the UK,
please?

Thanks for your help!

From: DCroker@fortress.org.uk
Message-ID: <1291_DCroker@fortress.org.uk>
Source record: 15921

Nostrodamus phrophesised this from williams@mustang.ecsel.psu.edu to All...

Hi Ken!

w> Hi folks, I recently acquired an Atari SM124, and I've noticed two
w> things about it (HA, hard not to notice!). They are:
w>
w> 1. There's a good 1.5" chunk of blank screen at the top
w> and bottom of the screen, and about an inch on either
w> side.

That's normal behaviour. It's possible to tweak the picture size to fill the whole screen if you know which bits to twiddle and take appropriate safe working practise.

Better still IMO is to use a hardware gizmo such as Overscan or (better) LaceScan that will actually utilise that black border as extra working area rather than just making the original pixels bigger in the way that my first suggestion would.

w> ...but the desktop looks crooked on the monitor every now
w> and then. Some people see it, some don't.

If the picture's rotated then you will need to tweak the coils round the tube, I suggest getting a repairman to do that.

Speak to 'ya later!

No - the Atari programmers made it so your ST will last until 2108 -
which is a /reasonably/ long time. :-)

As I'm new on here, i'd like to say a quick hello to all
the fellow Atarians that are on here.

Right. Question:

I'm the proud owner of a re-housed Mega 1 ST upgraded to 4Meg. Does
anyone have any information regarding the DIY installation of a
graphics card for the above machine?

Any info would be greatly appreciated.

With Thanks,

Trevor.

It would be very difficult because of the load on the bus already.
Why don't you use a CENTurbo card which can display a 640*480TC
at 66Hz with better performance than a normal Falcon in 640*480*16
colors?

2649. Keyboard Processor / Joystick Input / Games / Speed

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-13 00:00:00 UTC
From: warpstar@typhoon.xnet.com
Message-ID: <5vepc7$266$1@flood.xnet.com>
Source record: 15934

Dear Person(s),

Been trying to write a simple game demo for an Atari STe utilizing both the blitter chip and the Joystick.

My blitter chip routines work good. I got them done a few weeks ago. I have words to clear the screen, build a background, blit a player (with fully random x y coordinates) and move a constructed background to a screen buffer. This is all my own assembly code.

My problem right now is with the keyboard processor/joystick input. I tried using the Keyboard Interrogate mode, and that was ok, except that it slowes down my program to such a great extent that its ludicrous. For example, I created a simple loop to move my player from one side of the screen to the other by incrementing X from 0 to 320, the width of the screen in pixles. It took the player only a split second to do this. But, when I inserted a call to the Interrogate Mode of the keyboard processor via Bconout it takes my player *THREE* seconds to move from the left side to the right side of the screen. I'm not even calculating joystick directionals, just calling the Interrogate Mode. ARGH!

I've been messing around with various things on the Ste such as other keyboard processor modes and direct hardware reads. But, I have not yet stumbled upon the right thing.

I know that there are games that you put into the floppydisk drive of the ST, and then turn the machine on. They don't used TOS. They probably use the 70 or so K that TOS takes up in RAM for its own purposes. I think that most professional games don't use TOS at all. So, I wonder how they use they joystick while maintaining Maximum Speed.

I'd love to be able to bypass TOS altogether as far as keyboard and joystick input is concerned. Do I have to reprogram the keyboard processor?

I tried reading the 6850's memory location while switching on the Automatic Return Mode for the joystick. This seemed to work at first, but when I placed my blitter routines (which use HOG mode) into a loop with my reads the 6880's memory location, the joystick movement was semifuctional. It was fast as heck when it did work, but it seemed that I would have to jiggle the joystick really fast to get it to go, and then the player would go part of the way across the screen and then stop.

Man, this sure isn't like the good old 8bit days isn't it?

I'll probally get it right someday. Ideas and information on this subject would be greatly appriciated. Thank you.

Jason (Warpstar) Damisch

Source record: 15938

I've recently enabled SCSI arbitration on both my Atari TT and Falcon and was wondering if there are any things to be wary of, like writing to a partition on both machines?

One thing which seems to occur is that I cannot boot both machines up together otherwise they both go around in cycles booting up and then resetting.

Spencer

2654. Help! TT floppy died again

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-14 00:00:00 UTC
From: bdc2@po.cwru.edu
Message-ID: <5vfmje$o8p@alexander.INS.CWRU.Edu>
Source record: 15939

This is absurd! I have two TT's, and have been trying to
rearrange them so I can give one to my daughter. A couple of nights ago,
I posted about my floppies "disappearing" on one of them. Under thing,
when clicked on a floppy, or typing alt-A, which should open it, it just
dings. Under the desktop, I get a message

Device A: does not exist

And then after making the post to CSAS, and playing with the SCSI port,
un-plugging and then plugging in my ZIP drive, it started working.
Tonight, I swappped memory between them, (one had 4+4, and the other
10+16, both Atari boards) and now the other computer has the floppy locked
out!!! Is there a virus that does this shit? Has anyone ever heard of this?
If I try cold booting for a floppy, the light doesn't even go on.
It's not power shortage, cause the second TT is in a tower case, with a
separate, large power supply. UI am going wild, trying to figure it out.

Can anyone help? Has anyone encountered this before?
CPX's that look at the disks don't see it. It makes no sense to me.

HELP!!!
Boris Cahan

In a message of <04.09.97>, Derryck Croker (90:102/108) writes:
S>>> OK, this is a line produced by Shift Hyphen.
S>>> ▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯▯
S>>> Note the gaps, your line is gap free??..
PW>> Not with MyBlue 8 ANSI font loaded it wasn't! I loaded the
PW>> message into my editor and added a few underscores _____

This time when I saw the above, the 2nd line is a row of umlaut-y,
just like you reported. It stayed that if I switched to Courier too,
and Monospace 821. On the other hand, my extras in the last line showed
a continuous underscore in Courier and Monospace!

DC> In LED, Switches, convert MIME-style.

Yeah - what about it? I mean I know it's there, but have no idea when
to use it or what it does. From the name I assumed it was something
to do with Mime encoding, and couldn't see how that applied....

Regards
Peter

Is there any "crack/patch" for the free ATARI-ST emulation "GEMULATOR
CLASSIC" for MSDOS computers so that I may use a TOS.IMG on harddisk
instead of the EPROM card ? In my AT-486 PC, there is no slot available
anymore (I may prove by photo!), so...

I am not interested in the new *demo* version of the current
GEMULATOR 96 or 97 which works with a TOS.IMG file on harddisk, because
it's a *demo*.

Look at my homepage about ATARI and free emulators
http://home.pages.de/~h/atari.html

Sincerely
Rolf

If the joystick is your only input, you can set the IKBD for
Joystick monitoring mode and it will continuously generate joystick
reports. If you want to also monitor the keyboard, you should
remain in normal mode and use the joystick event reports (which
report changes in the joystick status).

In both cases, however, you will need to replace the joystick report
handler using Kbdvbase(), since TOS ignores joystick reports.

BTW, the STE enhanced joystick port does not go through the IKBD and
is directly accessable (in supervisor mode) through addresses
$FF9200 and $FF9202.

2663. ATARI-ST emulation, GEMUL8R.INI

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-15 00:00:00 UTC
From: Rolf Hemmerling <hemmerling@geocities.com>
Message-ID: <341D1094.1883431D@geocities.com>
Source record: 15798
Cross-posted to: comp.emulators.misc,comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy,de.comp.sys.st,fr.comp.sys.atari,maus.sys.atari.hardware,maus.sys.atari.talk,maus.midi,fido.ger.atari,comp.emulators.misc

I would like to use the free ATARI-ST emulation "GEMULATOR CLASSIC"
(Version 3.6, not GEMULATOR 96 !!) for MSDOS computers so that I may use
a TOS.IMG on harddisk instead of the EPROM card. In my AT-486 PC, there
is no slot available anymore (I may prove by photo!), so...

I just downloaded the GEMULATOR CLASSIC executable file, and I got a
GEMUL8R.INI file from a friendly newsgroup reader. This file is
accepted by GEMULATOR CLASSIC, as I may see if I change a parameter for
the RAM size. But: The sender of this initialisation file did not know
exactly the syntax of the parameter to let the GEMULATOR CLASSIC take a
TOS.IMG file and to avoid the scan of the ports.

This does not work in the GEMUL8R.INI file, currently

magic=c:\tos.img
magic c:\tos.img
(so with and without the "=", probably without the "=" is right)

magic c:\magic_pc.os
(from the MAGIC-PC demo)

So what is the keyword (or which TOS version works right), so that no
scan is done by GEMULATOR CLASSIC ? In fact, although I don't own an
EPROM card, GEMULATOR CLASSIC insists on that there is a EPROM card at
port $240 !!!

On their GEMULATOR CLASSIC download page, they say
>Gemulator Classic supports all the same operating systems as Gemulator
> 96: .., TOS 1.0 on disk (the original 520ST disk based TOS) and TOS
> 1.4 on disk (the 1988 developer release), and MagiC 2, MagiC 4 and
> MagiC 5 on disk including versions of MagiC that come with MagiC PC
> and the MagiC PC demo
So it should work, but it does not yet.
The GEMULATOR 96 demo finds the ROM images, properly.
Is there anything special with the TOS on disk (so that these versions
may be recognized, but no other ?)

I would be interested to get all "utilities" and online documentation
for the GEMULATOR CLASSIC, for free.

Look at my homepage about ATARI and free emulators
http://home.pages.de/~h/atari.html

I got all TOS versions from
http://www.fatal-design.com/desktop/

I understand that the MAGIC_PC.OS image needs the C:\GEMSYS folder from the original demo version of MAGIC copied to my local drive C:, as it does with the GEMULATOR 96 demo.

Sincerely
Rolf

Spencer Davies wrote:
>
> I've recently enabled SCSI arbitration on both my Atari TT and Falcon and was
> wondering if there are any things to be wary of, like writing to a partition
> on both machines?

You must not write on the same partition unless you somehow ensure that
before writing the computer that is to write new data has updated its
hard disk (GEMDOS) cache contents. This can be done by forcing a
mediachange. Some desktops do this when pressing Shift-Esc. Some hard
disk software (e.g. HDDRIVER) comes with a program to simulate a media
change.

> One thing which seems to occur is that I cannot boot both machines up
> together otherwise they both go around in cycles booting up and then
> resetting.

This should work. You are sure you provided unique SCSI IDs for your
machines? And you are also sure, that the programs you have in your boot
partition's AUTO folder work on both machines. If not, you should select
different boot partitions for your machines.

: I've tried the slattach stuff, but figured out I needed dip. I
: configured dip, and it just hangs. I'm using the device /dev/modem2,
: which at least responds with garbage when I use minicom to talk to
: the SGI.

I haven't used DIP for a while, but when I did use it for SLIP I believe
it was straight-forward.

For a SLIP serial connection between two local machines, however, I just
used slattach and this seemed to do everything necessary.

: (garbage: it returns a few random characters after I press return - I
: assume this is the 'login:' prompt from the SGI, after it's been munged
: somehow)

Perhaps the baud rates are set differently at each end.

: So, I think I'm using the correct device, I think I have the correct
: software (dip), and I think the line works ok. The only thing I can
: think of is that the MiNT drivers can't handle 38400 baud.

I've used 115k2 connections with MiNT without a problem, even with the
older MiNT that supposedly could not handle connections higher than 38k4.
Since you're only using 38k4 there certainly shouldn't be a problem.

: I seem to remember that ST's (Falcons too ?) couldn't drive the serial
: hardware at high baud rates... Is this my problem ? And if so, how do

The Falcon's serial port operates at speeds up to 115k2, I believe.

: I looked through the version of MiNT's tty.c, and it seems to indicate
: the serial lines can go as high as 230kbaud (wow!), but maybe it needs a
: .xdd driver...

Not that I know of.

I am not exactly what is wrong, but maybe my comments will help you to
figure it out.

>> I posted this on the other section, but I thought I would cover all my
>bases.
>>
>> My question. I've seen text files on modifying ST's with VLB VGA cards.
>> I am wondering if this can be done to the Falcon too. Sure, the Falcon

That can be done rather easily. The NOVA Falcon gfx card is a normal PC
chip (with it's own memory sub system) that is fitted to the Falcon CPU slot.

>> already has VGA graphics, but they are slow and eat up main memory to
>> generate them. That sucks. So, my question is, can you modify a Falcon
>to
>> use a VLB card? (let alone are there any drivers...) That seems like it
>> would be a better alternative than using something like Blow Up or
>> Screenblaster.

It is.

>
>It would be very difficult because of the load on the bus already.

That's completely irreleveant.

>Why don't you use a CENTurbo card which can display a 640*480TC
>at 66Hz with better performance than a normal Falcon in 640*480*16
>colors?

PC VGA chipsets use their own memory subsystem. Also all newer
chipsets have very advanced blitters and also 3D drawing support.

What does this mean?

The normal Falcon's gfx system steals cycles (ie time) from the
CPU when displaying graphics on screen. A VGA chipset use it's own
memory for storing the framebuffer and thus it steals no CPU time
even when displaying very high resolutions. The onboard blitters
of the VGA chipset also use this memory so blitting don't hog the
CPU either.

The VGA chip have a "host" port which the host can use for accessing
the chipset's memory. This port is on modern VGA chipsets much faster
than the Falcon's normal memory.

Using a bus overclocker and video subsystem overclocker is only a
cheap and bad alternative to a dedicated gfx card.

Summary:

A VGA chipset fitted to the Falcon's CPU slot (for example the NOVA gfx card) is MUCH faster (up to ten times as fast) than Falcon's own video hardware.

It does not hog the CPU like Falcon's video subsystem do.

My piece of advice: If you want faster gfx and higher resolutions buy a graphics card.

Istari Software is working on a combined PCI bridge/CPU accelerator for Falcon making it possible to use cheap PCI boards on a Falcon.

>please?

The only one I can think of is the german PAK/3 board. However I
don't know if it got a STE version since it is developed for
the ST which has a normal DIP 68000. (STE doesn't have a 68000
in DIP casing.)

In english:
I am looking for tools (and docs) for the free ATARI-ST emulation "GEMULATOR CLASSIC" version 3.6. Especially a configuration software for the GEMUL8R.INI file and infos about the options, any tools to create virtual disk image files, infos how I may include a plain MSDOS drive (2 GByte MSDOS partition on my big PC) for GEMUL8R.., the special keyboard functions mapping, maybe from an earlier demo version (the current free version just consists of the GEMUL8R.EXE file.

I still need the software program to generate the virtual disks (and to copy to and from them), and any configuration option, infos and software for partitioning harddisks to include a plain drive (C: as C:). My MSDOS partition is 2 GByte (and there is a hint in the online infos, that a plus for the GEMULATOR 96 is the "Support for very large hard disk partitions, CD-ROMs, and network drive" and "Earlier versions of Gemulator required setting up separate Atari ST hard disk partitions, and while this is still an option it is no longer required.". So probably I don't have true harddisk support on my big PC on my MSDOS partition !

I got two GEMUL8R.INI files from a friendly newsgroup readers, but.. if You got another rather-complete "big" GEMUL8R.INI file with comments.. I wuold be interested in it, still.

Please answer me personally too !

Auf Deutsch:
Ich suche noch Hilfsprogramme (und Dokumentation) f&#65533;r die freie ATARI-ST Emulation "GEMULATOR CLASSIC" Version 3.6. Besonders Konfigurations-Software f&#65533;r die Datei GEMUL8R.INI und Infos &#65533;ber die Optionen, irgendwelche Programme zum Generieren von virtuellen Disk-Image Dateien f&#65533;r GEMUL8R, Infos wie ich reine MSDOS Laufwerke einf&#65533;ge (2 GByte MSDOS Partition auf meinem gro&#65533;en PC), die Tastaturbelegung f&#65533;r spezielle Funktionen.. vielleicht von einer fr&#65533;heren Demo-Version (die aktuelle freie Version besteht nur aus der Datei GEMUL8R.EXE).

Ich brauche noch das Software-Programm um die virtuellen Disks zu generieren (und von und auf sie zu kopieren), und irgendwelche Konfigurationsoptionen, Infos und Partitionier-Programme um ganze Laufwerke einzuf&#65533;gen (C: als C:). Meine MSDOS Partition ist 2 GByte (und es war ein Hinweis in den Online-Infos, da&#65533; einer der Pluspunkte f&#65533;r den GEMULATOR 96 ist "Support for very large hard disk partitions, CD-ROMs,

and network drive" und "Earlier versions of Gemulator required setting up separate Atari ST hard disk partitions, and while this is still an option it is no longer required."). So habe ich wahrscheinlich keine wahre Harddisk-Unterst�tzung auf meinem gro�en PC auf meiner MSDOS Partition !

Ich habe zwei GEMUL8R.INI Dateien von zwei freundlichen Newsgroup-Lesern erhalten, aber.. wenn Ihr noch eine ziemlich-komplette, kommentierte, "gro�e" GEMUL8R.INI habt.. h�tte ich immer noch Interesse.

Bitte antwortet mir auf jeden Fall auch pers�nlich !

I read the last postings in this thread and could not resist to try it
out myself. The posted ini-file worked fine after I changed the name of
the TOS-Image (I put the TOS-Image in the same directory as the
Gemulator so there was no need to specify a pathname). Gemulators
starts, reads the ini-file, scans the port (don't know how to avoid
this) and then runs with the TOS from the file!
Now this is where the problems start when working under Windows NT.
Gemulator tries to access the disk and the COM-Ports directly which is
blocked by NT. It also tends to "hang" after a while.

Lacescan is both hardware & software.

The hardware changes the 'DE' (Display Enable) signal on the ST, to allow more visible pixels.

The software adapts GEM to work with new resolutions & also allows emulation of larger resolutions.

The hardware does NOT work with STE's.

I am using a Janus card in my machine. I found OS/2 to be much better
for this purpose. Just wanted to mention how I solved this problem.

I just assume Gemulator will run fine under OS/2 (or Windows 95) as
well.

Have fun.

Hoi,

A friend of mine has done something very stupid. He pulled out the
flatcable of the internal harddisk of his Mega STe whilst the harddisk
was on. Now he can't use the harddisk anymore.
When he switch on the computer it sounds like the harddisk comes to
speed but that's all. The led doesn't light up. If he does an ID-check
the system doesn't see the drive.
My friend would be very happy if someone could give him a solution to
bring his drive alive. (He didn't make a backup of the drive)

thanks
Martin

This sounds BAD!!! If the HD does not do its Power On Self Test (the
usual SCSI chattering after it comes up to speed) it probably means
that it cannot read its microprogram from the HD (medium corrupt or
boot-ROM broken).

If the disc data is VERY valuable and there is a manufacturers agent
nearby he MAY be able to have the microprogram re-installed.

... but, I really think, ... resquiescat in pace :-(

Locate the fuses on the harddrive and see if they are broken. If you're
lucky all you need to do get the harddrive working again is to replace
them.

All the best,
Daniel

2685. EDO Memory chips work on the Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-17 00:00:00 UTC
From: lynxpro@aol.com
Message-ID: <19970917045301.AAA03719@ladder01.news.aol.com>
Source record: 15820

If anyone is interested, I thought I should report this to every Falcon owner reading this section.

A couple of days ago, I decided that I wanted to upgrade the memory in the Falcon. After a year of neglect where I embraced the PC platform and bought a Pentium, I neglected my trusty Falcon. Since buying the Falcon in 93, of course, memory chip prices have come down drastically, so I was finally able to afford to upgrade the Falcon to where I really wanted it to be back in 93, at 14 megs.

So I went down to the local Fry's Electronics on Sunday and bought a 16 meg SIMM. I didn't know that it was parity, I just knew that it wasn't EDO memory, which I pretty much assumed (and was told by many) that EDO was both unnecessary and probably would not work with the Falcon since Macs hated EDO memory. So I got the parity memory installed in the Falcon. Guess what? The Falcon would not work with the SIMM. So I swapped it for an EDO 16 meg SIMM, and the Falcon loves the memory! So go out and get EDO because it will probably work more reliably than parity if you are looking to upgrade your Falcon.

Many thanks to STeve of STeve's Computers in Woodland, CA for fixing my less than "handy" work. You can reach STeve at www.woodland.net or at (916) 661-3328. Give him a call for Atari ST, TT, Falcon, Jag, 8-bit, and Portfolio. If he doesn't have it at the storefront, it's probably at his house, so don't hesitate to call...

Jeremy

In english:
I got now the free ATARI-ST emulation "GEMULATOR CLASSIC" version 3.6
up and running, see report with tricks and tips on my ATARI homepage
http://home.pages.de/~h/atari.html

One last question:
The only way to copy from and to virtual disks of GEMULATOR classic is
either running GEMULATOR CLASSIC and copying to and from floppy disk or
running the later, not latest GEMULATOR 96 V4.5 demo and copying to and
from the real MSDOS harddisk partititon (even if this partition has a
size of 2 GByte, as it is usual today)

So please users/buyers of GEMULATOR CLASSIC, what is the maximum
partition size of MSDOS partitions that GEMULATOR classic can handle
for direct disk access ? Is there a 32 MB partition limit of ATARI-TOS
for MSDOS partitions ?

Please answer me personally too !

Auf Deutsch:
Ich habe die freie ATARI-ST Emulation "GEMULATOR CLASSIC" Version 3.6
nun zum Laufen bekommen, siehe meinen Bericht mit Tricks und Tips auf
meiner ATARI Homepage
http://home.pages.de/~h/atari.html

Eine letzte Frage:
Die einzige Art und Weise, wie man auf die und von den virtuellen
Harddisks kopiert ist, entweder GEMULATOR CLASSIC laufen lassen und
�ber Floppies zu kopieren, oder die neuere (aber nicht neueste)
GEMULATOR 96 V4.5 Demo laufen zu lassen, und dort dann auf und von der
realen MSDOS Partition zu kopieren.

So liebe Nutzer/K�ufer von GEMULATOR CLASSIC, was ist die maximale
Partitionsgr��e von MSDOS Partitionen, mit denen GEMULATOR CLASSIC
zum direkten Dateizugriff umgehen kann ? Gibt es das 32 MByte Limit
von ATARI-TOS f�r MSDOS-Partitionen ?

Bitte antwortet mir auf jeden Fall auch pers�nlich !

Tschau / Sincerely

I have acquired an 520STfm which on close inspection has a 512K upgrade fitted. The upgrade is by frontier systems and has 4 simm slots, of which 2 are taken with 256k simms. Is there any way to get more memory onto this board? I have added 2 further 256k simms into the empty slots but they are not recognised. Will it take 1MB simms ?

Any info would be appreciated!

Yea, What Uew said!:).
Why not just use AHDI until you can afford HD Driver?
I myself would like to see futher developement of the application.
Giving away copies is not very supportive of this.

Chill out guys.

My message asked if someone would either SELL or email me a copy. I don't like pirateware either as it slows down the development of future programs, but I can hardly be expected to sit on my ass and do nothing while thy're trying to write the manual. I cannot afford to go on a holliday in the meantime, I need to work. I did not want to offend anybody with this question, but there's nothing wrong in using a borrowed version or whatever until the definite version is there and can be bought - which is what I intend to do. It is not my fault that some people do not go out and buy a legid copy later. I will not be associated with them. This has absolutely nothing to do with money!
Hope this explains the confusion.
Friends again?

I know on the PC, the SCSI bus is reset on a power up. Could it be that
one machine is trying to find the common drives when the other machine
resets the bus, causing drives to disappear and prompt a CPU reboot?

Just how _do_ you change the ID settings for the TT and Falcon
controllers so that they aren't both 7?

Usually, pulling a data cable during a read or write won't hurt the drive. It _will_, however, damage data if you're writing. Either your friend was extremely unlucky, or the drive simply needs to be repartitioned. If it is repartitioned the same, he may not even lose any data beyond that being written at the time the cable was pulled.

Source record: 15829

I had a similar problem long ago with my 1224. It was something called
a flyback module if I recall. I had it fixed (twice) by Atari when they
had
a local office here. However, I do recall that it was anyting but
quiet.

Nostrodamus phrophesised this from tjs@zetnet.co.uk to All...

Hi Trevor,

t> As I'm new on here, i'd like to say a quick hello to all
t> the fellow Atarians that are on here.
Hello yourself! (g)

t> I'm the proud owner of a re-housed Mega 1 ST upgraded to 4Meg. Does
t> anyone have any information regarding the DIY installation of a
t> graphics card for the above machine?
I had a Titan Reflex graphics card in my STFM, it's plug and play in a Mega ST as it's designed to plug into the bus expansion socket.

You won't be surprised to learn that it isn't being made any more, so you'd have to search for a secondhand one, and it's monochrome.

Speak to 'ya later!

It was of the type that you scrolled to the edge and moved about rather
than having all the extra pixels on screen at once.

I know its possible to overscan in software in games and demos but is it
possible to use these techniques for the desktop, particularily in the
STE which I have aswell, or would that use up too much CPU - and would
like more screen!

```
THE ATARI ST QUICK FAQ
v2.0 - September 12th 1997

In order to save bandwidth and avoid comp.sys.atari.st newcomers asking
the same questions over and over again, here is a quick list of the most
Frequently Asked Questions (FAQ) and, hopefully, useful answers.

http://www.geocities.com/MotorCity/2090/quickfaq.htm USA
http://wwwperso.hol.fr/~nbales/quickfaq.htm Europe

or

ftp://ftp.sn.no/user/hallvart/atari/info/quickfaq.txt FTP/ASCIIA

If you don't have web or ftp access, send me an e-mail at the following
address, and I will be happy to send the FAQ to you:

bales@hol.fr

This announcement is manually posted once every week.

Nick

WinNT does not allow User level applications to directly access the hardware.
This is why WinNT is more stable than Win95. I don't know if DirectX for NT
will help, it still needs to go through the IO manager but it is suppose to be
more resistance to direct hardware access by applications.

AFAIK, Dave, the STe has not been emulated fully. Stock ST models have been
though. You should go to the Pacifist homepage, and try it out. There is also
another emulator called "Tos Box" available there. As far as the images go,
you can get them from www.fatal-design.com, via Web page or ftp.

Now, let me give you my opinion. <grin> Used STe's are going for next to
nothing these days, and it would be a lot easier for you to pick up a used
STe/monitor for cheap, and have -full- emulation. Something that probably
will not be achieved via emulation for a long time... Just my 2 cents...! :)

2704. TT 16 meg upgrade problems

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-18 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <5vrhtv$3sj@ccshst05.cs.uoguelph.ca>
Source record: 15839

I recently purchased a TT 4/16 meg fast RAM board from B&C in order to take advantage of the 4 meg SIMMs I had sitting around. Unfortunately, my TT won't work with the 16 meg upgrade. The symptoms are:

-- works fine with old non-upgradable 4 meg board.
-- new board works fine with 1 megs SIMMs from old board, with jumpers set for 4 meg total
-- doesn't work with new 4 meg, 8 chip, non-parity, same manufacturer SIMMs with jumpers set for 16 meg total, page mode
-- with 16 megs, output to colour monitor remains black (ie, not even a blank white screen); output to TTM195 is snow with white horizontal bars moving downward
-- floppy drive doesn't power up; hard drive does (but obviously the desktop doesn't appear)

Is this a "merely" a case of a bad SIMM, SIMMs incompatible with the board, or is my early revision TT (we're talking Rev.A or so here) motherboard simply unable to handle 16 megs of TT RAM? I sort of suspect the former, since the latter seems inconceivable, even for an early revision. The middle possibility seems unlikely since I got the SIMMs from Baber Information Service on a recommendation someone posted in CSAST, and I'm assuming they would have gotten the same kind of SIMMs as I would have.

Euh.. my name isn't boby, but I can try help all the same ;-)

> Is there such a thing as a software only emulator for PC to use Atari
> STE software? All the emulators that I've tried so far ask for ROM chips
>

Actually most of them don't ask for ROM chips, but ROM images, which are
files that contain the contents of the ROM chips. However, the Atari TOS
ROMs are still under copyright, so they can't be freely distributed. The
image files that are floating around the net are pirate.

There are several utilities that allow you, if you have a real ST, to
make a ROM image for use with an emulator

Most emulators are ST only, not ST*E*. The STE has some specific
hardware that nobody has emulated yet. If it's generic ST software you
want to run, no problem, but if it's STE only stuff, you're out of luck.

Anyway, all this is in the Quick FAQ... see below!

>Anthony

A PC owning friend of mine is using Pacifist with TOS 1.04/2.06 now, and it
does show the Blitter option from the desktop. However, no STe specific apps
, demos, or games would run on it when we tried. We also switched the Blitter
off/on, then opened/closed windows to see if we could see a difference, but
we couldn't tell a difference on his P133... Pacifist is quite an amazing
program but still would not replace an STe setup. I for one, would not give
up an STe to use my Atari software on a Pacifist equipped PC...let alone a
Mega STe, TT-030, Falcon, or Hades... <grin>

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a
Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM
Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4.
(2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a
Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari
Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar
Systems. If you have what I'm looking for, check my Atari Catalogs or
E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an
order of enough of my stock. One example, a customer ordered over $200
of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. Everything mentioned on this list is on this list
because I have multiples of these Items and I thought I'd list them for
you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. And
Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore
CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives,
Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct
Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM
804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome
Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

2717. Help: Can't upload

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-19 00:00:00 UTC
From: tross3@hamtel.tds.net
Message-ID: <5vsrgo$h36@news2.tds.net>
Source record: 15852

I need some recommendations. Here's the situation:

1. I'm on a 4 meg 1040 STe with 1 720K drive & no hard disk.
2. I need to upload ASCII files to an ftp site that won't accept a passive (PASV) connection - only PORT & STOR.
a. NEWSie only uses PASV.
b. MG-FTP uses PORT, but only uploads in BINARY and text files aren't getting through.
c. The sites file management utilities do not include any unZIP utilities, so if I compress it to upload as a binary file, I can't uncompress it.
d. I've tried AFTP, but it won't run with my ancient AES. Same with another program. I don't have a hard disk, so trying to set up a Unix system is out of the question. Oasis 2 doesn't seem to do anything useful, it sends and receives packets, but that's it.
--- Am I missing any options here? Is there another program I might try? I've tried calling my ISP to see if I could log on with a terminal program but I've spent 70 minutes on hold, over the space of 3 calls, and have never reached them. Am I going to *have* to just go down to an internet cafe and upload the files on a PC compat? sheesh... :)

Thanks for any info you might be able to provide.
Terry

> Fireball ST 2160Mb Ultra-SCSI, would it work?

This drive should work. Generally any SCSI drive works. Note, however,
that the Fireball requires that you use a driver that supports initiator
idenfication, e.g. HDDRIVER. Otherwise your drive won't be recognized.
Also note that you won't be able to boot from drives requiring initiator
idenfication. In case you boot from an internal IDE drive, this won't
matter.

Hi Dr. Siemet... Sorry to butt in on this thread but this Fall I'll be
upgrading my BBS's seriously cramped 52 meg Quantum to a (much) larger
hard drive. This is my BBS's hardware:

Mega ST 4, TOS 1.04, Adspeed (16mhz)
The Link II from ICD
2 Pioneer 6-pack CD-ROM changers
EZ-135 SyQuest

So I gather if I bought a Fireball drive to replace my current Quantum,
it wouldn't boot up? Thanks for any input...! :)

PS By the time I get the drive
I should be using HDDriver
version 7... :)

Yes, you can. Contact any good Atari dealer in your area and ask about
memory boards for your 1040 ST (BTW, if its an STe, all you have to do
is take out the old 256kb SIMMs and replace them with 1 meg versions).
You will have to buy 4 1 megs SIMMs for it as well, but prices are cheap
for Ram now... The memory board hooks up to most ST's with no soldering.
Have fun-you'll love the increased memory! :)

Yes, up to 4Mb. The easiest way is to use Frontier or Marpet expansion
boards which use standard SIMM RAM and are fairly easy to fit. In the
US your supplier is probably BeST Electronics.

Yea, I didn't notice a difference on my K6-166, but thats problably because you
are now emulating hardware in software instead of emulating software
in software
- ie. its not likely to be much faster than the software equivelent (although
a little faster because all in native mode)

> Pacifist is quite an amazing
> program but still would not replace an STe setup. I for one, would not give
> up an STe to use my Atari software on a Pacifist equipped PC...let alone a
> Mega STe, TT-030, Falcon, or Hades... <grin>

I agree, but if I used mainly GEM apps, I would replace an ST with TOSBOX
running in 800x600x16...

(neither is displacing my Falcon at the moment).

Anthony

h> Yup, I'm here ;-)
h> I've got an Ste and therefore can't do any overscan modifications
h> myself, but Lacescan as far as I know is both hard- and software
h> orientated. I believe "Atari computing" had a feature about it a little
h> while ago. I'll check which issue if you want me to.
Yup. I wrote it (g)

h> (There was a software only version of it which should work for the STe,
h> but I never got it to work, so I gave it up).
Slight difference, the emulator when run without the hardware will only give
you the normal size screen which then acts as a window onto whatever size
screen you've set the emulator for.

The emulation does work but you do need to pay careful attention to the docs,
there's a couple of ways to config the emulator.

Speak to 'ya later!

Hi,

I just talked to the poor guy and it seems he can't find any fuse on
the harddrive. Are you sure there is one and if so where is it
located?

I don't think it's that valuable. But just in case, can a good ex-Atari
repairer do the job?

2740. Problems with some Cab modules...

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-19 00:00:00 UTC
From: pascal.ricard@hol.fr
Message-ID: <381pricard@hol.fr>
Source record: 15875

Hello All,

I allready said this in c.s.a.st but this place seems to be more appropriate
to speak about Internet problems ;-)

Suddenly I can no more use the modules that usually "speak" to the modem:
CabDload, CabCheck, CabSurf are launched normaly but do not sent anything to
the modem, with any of the ovls.

However the "normal" navigation works ok.

Using Cab 2.5a under Multitos with ovl 1.2618 or 1.81 or ppp-connect.
With the later I get a bus error on the module that I want to use.

Any clue ?

Bye All,
/Pascal/

Really? Hmm...how are they doing that? I mean, the interface is totally
different, unless they are removing all the Ram chips (ugh-that would be
a job!), and then re-using them in a different board... Just curious! :)

The point is, if you are like to use ppp-connect, so you have to
use that .ovl what you found after your installation of cab 2.5 & ppp-connect.
Any other ovl. can't work with ppp-connect & cab.

Also your modules does nothing..
The .ovl's are different!

FALCON BASED DIGITAL AUDIO RECORDING SYSTEM

In excellent working condition. Check carefully for the items. They are good and the best on their category! This system works fine and you will be able to produce your music in the digital domain. Whether sequencing or audio editing, it performs fine.

1. Falcon 030 with 16 MB RAM. All required Steinberg audio & timing fixes have been done. Line level audio in.
2. 2.5' 60MB IDE Hard disk
3. Wizztronics DEKA interface for using external keyboard
4. Honeywell keyboard
5. Beetle mouse
6. SCREEN BLASTER II (for higher screen resolution)
7. Wizztronic Cart Master LIte (allows plugging in two cartridges at once) (for Cubase and Zero-X)
8. Monitor adapters for VGA and Atari Monitors.
9. Steinberg FDI (DSP PORT Digital interface for digital recording: DAT; CD, etc.!!)
10. External 1GB SCSI (no thermocalibration) Seagate hard disk.

SOFTWARE:
(all are original disks & include manuals)
STEINBERG'S:

1. Cubase Audio V2.06
2. Studio Module
3. Cue Trax
4. Style Trax
5. Data DAt (for backing up files to DAT)

---

6. Zero-X (Superb sample editing program)
7. BAnd-In-The-Box
8. ExtenDOS PRO 2.4a (CD-ROM driver with direct CD record to hard drive)
9. HD Driver 6.0 (Best Hard Disc manager for Cubase Audio)
10.ICD SCSI PRO Utilities 6.55 (covers things not handled by HD Driver)
11.XBOOT (Wonderful program launcher)
12.Diamond Edge II
13.Diamond Back III
14.Steno
15.Stalker
16.Image copy 4.0
17.CD-ROMS & MORE software.

Price: $ 1350 OBO. Repply to fpinto@byu.edu for more details. I rather sell the entire studio to one buyer. Phil.

u> forcing a mediachange. Some desktops do this when pressing Shift-
u> Esc. Some hard disk software (e.g. HDDRIVER) comes with a program
u> to simulate a media change.
Ok, thanks for the information.

u> This should work. You are sure you provided unique SCSI IDs for
u> your machines? And you are also sure, that the programs you have in
Yes, the TT is set as ID 6 and the Falcon as ID 7.

u> your boot partition's AUTO folder work on both machines. If not,
u> you should select different boot partitions for your machines.
The Falcon boots off of the IDE drive and the TT boots from its internal SCSI
so neither use the same boot partition.

Thanks for the info. My main interest is in sharing data between the two
machines.

Spencer

2760. Atari Monitor Adapter?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-21 00:00:00 UTC
From: jpoll@interlog.com
Message-ID: <jpoll-2109971819080001@ip213-72.cc.interlog.com>
Source record: 15895

Hello fellow Atari fans,

This is my first time on this particular NG, so forgive me if this questions has been asked before:

I have an old Atari 1040 ST and an Atari MEGA STe. I used to run them on a SM124 monochrome monitor. What I was wondering is, is there any way to adapt the Atari's monitor output so that it can be used with my current Apple Multiple Scan 17" monitor? I also have a PC -> Mac adapter for my Apple monitor, so if anyone knows how to convert the Atari output to PC, that would probably be OK too. I have a 13-pin Atari monitor connector lying around in an old spare-parts box, so all I need is the appropriate wiring diagram... if any of this is even possible at all!

If I could get the Atari colour (and even the monochrome) resolutions up and running on my Macintosh monitor, that would be great!

Thanks for any info. Please reply to me personally, as I don't frequent these NG's that often.

JP

Some drives expect the computer to have its own SCSI ID. In order to
give a TT or Falcon a SCSI ID you need a hard disk driver that supports
this feature which is called "Initiator Identification". Without a
driver supporting this feature the Fireball is not recognized at all.

Yes and I guess that is a major problem. :-(

From what I have understod PPP-Connect works best unde a multitasking
system N.AES, MagiC or whatever, but it does work under TOS as well but
in a limited way.

I guess I have to get CAB, but first I have to pay for Papyrus 5!

2766. New Atari Pages

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-22 00:00:00 UTC
From: tross3@hamtel.tds.net
Message-ID: <604fat$im2@news2.tds.net>
Source record: 15751

Hiya everyone,

Well, after dinking around for a while, I've finally found a solution
to my ftp upload problem - thanks for reminding me of just NOS, I hadn't
really considered it after having had no luck with Oasis.
Anyway, I'm starting to put up some new pages, and I'd like for
people to stop by provide some constructive criticism either here, or via
email.
It's going to be an Atari program reference library. Maybe a couple
of files available, but primarily a spot where people can get more detailed
information on programs available for download, and current registration
information if they're wondering if that listed in the documentation is
still current.
There's not a lot up yet, just enough to give an idea of what I am
planning (btw, I know about the error in the PicSwitch page - just haven't
bothered to correct it as I am building the new page anyway). And I will
probably be adding a search facility soon.
Basically, I'm just wondering whether the concept is a useful one,
formatting suggestions for the actual description pages, other items
I might include, things of that nature.

>>> Finally, I would especially like for programmers to stop by and
take a few minutes to fill out the authors information form, and to
consider adding me to their mailing lists for notification of updates.

Here's where you'll find it:

http://www.geocities.com/siliconvalley/peaks/6320/atari001.htm

Thanks in advance for taking the time!

Here is my config':

Atari STE 4Mo, SCSI Host Adaptator Advantage+, HD IBM 548 Mo, CD-ROM Drive Sony 55-S, and sometimes DAT Tapes Drive or Optical Floppy Drive...

Here is my problem':

Some transfers (i.e. read and/or write) to my SCSI drives return wrongs data (i.e. file is not recognised, or the program crash...) and that's not depending on my software configuration. It's an only hardware problem. =(I heard something about timing errors on some STe's ASCI Port, and/or DMA's bugs... Is there any solution?

Thank you!

2768. Memory above 4 MByte limit

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-22 00:00:00 UTC
From: pls@no.spam
Message-ID: <605nh5$kd2@bcrkh13.bnr.ca>
Source record: 15753
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

I have put an extra 4 mbytes of DRAM above the MMU 4 Mbyte limit on an STFM.
I am using the original MMU + a small GAL to address this new memory.

Initially, I had problems where TOS 1.04 was not able to use this memory.

TOS 2.06 is able to use the memory, I use the Maddalt function to let it know
about the new memory.

I noticed that TOS 2.06 grabbed a chunk (16000 bytes) of this new memory for
itself right away. It appears to be using this memory as a buffer, for drop
down menus, window operations & possibly disk operations. Is this normal?

I believe this memory should be of the type 'TT Fastram', which means that It
cannot be used for screen or DMA operations. I expected it would be available
for programs only, I had hoped the system would not use it, but perhaps I am
mistaken here.

Does anybody know how/what happens when the ST finds extra memory?

From: Dennis Armstrong <Dennis.Armstrong@jet.uk>
Message-ID: <3426A618.41C67EA6@jet.uk>
Source record: 15755

Hi All,
Just a quick question about the terminating resistors on the SCSI bus
in the TT.

There are 3 removable terminating resistor packs in the TT, under what
conditions should these resistor packs be removed?

1) no internal SCSI drive
2) internal SCSI drive not terminated
3) internal SCSI drive terminated
4) external SCSI, no internal SCSI drive
5) external SCSI, internal SCSI drive not terminated
6) external SCSI, internal SCSI drive terminated
assuming that all the external SCSI devices are correctly installed
and terminated only at the last device.

regards

> it wouldn't boot up? Thanks for any input...! :)

Yes, exactly. With the ST/STE the only host adapter you can use a
Quantum Fireball with is the LINK96/97. In contrast to TT and Falcon,
where initiator identification can be provided by the hard disk driver,
for the ST/STE this feature has to be provided by the host adapter
hardware. The LINK96/97 is the only host adapter with initiator
identification support.

Well there has to be something for memory.Or else PKZIP would just keep eating
up memory until it crashed.I've run PKZIP on 1MB PCs before with no errors.
PKZIP was writen long beofre there were 16MB PCs.

Hello everybody,

I'm actually coming from the PC world, so I hope you'll excuse my poor knowledge in the atari world.

Questions 1 : My brother in lawn owns an atari ST and I'm trying to install a SCSI hard drive on it. This drive is a "PC" SCSI drive with a standard SCSI connector on it. From what I read in the different NG, it seems possible to install it on the ST but its DMA port (where it seems I have to connect the drive) is very different from the PC SCSI 1 connector. Does somebody have the pin to pin connection between those 2 guys ? Same question about a SCSI CD-ROM I'm about to get...

Question 2 : What is the difference between PC standard SIMM memories and Atari ST SIMM memories ?

Question 3 : Where can I get the last version of TOS (I read it's 2.06), so he can use 1.44Mb floppies ?

Thanks for your help

The ABC series was a set of PC compatible PCs. I didn't know there was
a laptop version, but I know that at least one of the others was based
arround the 80386.

Basically, most people around here wont be able to help with this. :-/

I believe the 'faulty' STE-DMA's are the same as the ST-ones. Later (i.e.
working) STE-DMA's are different from ST-DMA's.

Yes, the AES allocates a buffer of 1/2 the screen size (1/4 in pre-1.4
TOS) for that exact purpose.

> I believe this memory should be of the type 'TT Fastram', which means that It
> cannot be used for screen or DMA operations.

It is correct that you cannot set the screen display base to point to
alternate RAM, but the VDI can copy to/from it. The Blitter can't be used
to do the copies, though, so I'd imagine the VDI does a straight CPU-based
copy in this case.

> I expected it would be available
> for programs only, I had hoped the system would not use it, but perhaps I am
> mistaken here.

TOS is free to use any memory you add to the system as it sees fit. In
fact, you'll probably notice that desk accessories always load into
alternate RAM, regardless of their header flags. If you really wanted to,
you could probably write a hack to prevent it from doing so, but why
bother?

No problem-we "re-educate" the PC massess all the time here! :)

>Questions 1 : My brother in lawn owns an atari ST and I'm trying to install
>a SCSI hard drive on it. This drive is a "PC" SCSI drive with a standard
>SCSI connector on it. From what I read in the different NG, it seems
>possible to install it on the ST but its DMA port (where it seems I have to
>connect the drive) is very different from the PC SCSI 1 connector. Does
>somebody have the pin to pin connection between those 2 guys ? Same
>question about a SCSI CD-ROM I'm about to get...

Which ST does he own? It does make a difference. As far as the DMA port
on stock ST's goes-you will need an adaptor like the Link II from ICD or
Link 96/97. Most all Atari dealers/resellers will carry these. Once you
get the adaptor/software, then you will be able to chain SCSI devices off
of it, including the CD-ROM, but you will need software like ExtendDos Pro
to see the CD-ROM.

>Question 2 : What is the difference between PC standard SIMM memories and
>Atari ST SIMM memories ?

If its an ST(f, or fm) and not an ST(e), then you will have to have a
memory expansion board. With a memory board in place on an ST, or an
STe (which has its own SIMM slots) you will then be able to use standard
30 pin SIMMs from 80ns to 120ns, parity or non-parity. Most memory boards
and the STe support 4 megs of Ram (thats 4 1 meg SIMMs).

>Question 3 : Where can I get the last version of TOS (I read it's 2.06), so
>he can use 1.44Mb floppies ?

Be advised that if its an STe you can plug TOS 2.06 right in, (with very
little mod.). If its a stock ST, then you will need an adaptor board as
well... If you are already using TOS 1.04 or higher, then you could just
get a replacement desktop like Geneva/NeoDesk, Ease/MagiC, (both commercial)
or even TerraDesk/Thing (both are shareware). I would NOT use a stock ST
equipped with TOS 1.0/1.02 with a hard drive-too many bugs... If you do
go with HD floppies, you will have to replace your Floppy drive controller
chip and floppy drive too. There is a FAQ on this subject (as well as others
-I recommend you read them all) at ftp.sn.no/users/hallvart/atari/info/...

You are here in the States, right? If so, then you can try any of the
following dealers:

Best Electronics
Chro-Magic
Computer Direct
Systems for Tomorrow
Toad Computers

Good luck and continue to post any questions here-we'll answer 'em as fast
as you ask! :)

Hi All,

does anyone have a list of variables for the gemul8r.ini file for classic
gemulator?

I'm really not entirely convinced I'm configuring it optimumly as I can't get
it to use the .vhd files- as soon as something is saved on there (like say AHDI)
it cannot be used again.

Cheers,

(do please note, my email address at the top of this form is wrong - I've not figured out
how to solve this yet in tin: Correct address dh219@cam.ac.uk)

Nostrodamus phrophesised this from macdonal@cfcsc.dnd.ca to All...

Hi Ken!

m> Hi.
m> I've a MegaST with a 64pin bus expansion (according to Atari A-Z)
m> and I was wondering what it could be used for?
It's a bus expansion, all the processor pins are brought out here. You could plug a graphics card or PC emulator card in here for example (always assuming that you could get such things of course!) ;-)

Speak to 'ya later!

a>> I am moving to the UK in April. Can I change my power supply to a
a>> UK power supply? I am in Canada now.
SS>
SS> What is the spec for the canadian mains suppply, its 220V 50 hz
SS> isnt it, if so you'l need not do anything.

Much more likely to be 115V 60 Hz! He can either change the power supply for a 240V one, or (cheaper) get an (auto-)transformer 240-115V to run both the computer and monitor, HD etc and any other electrical appliacnes he may bring with him. Most don't mind the frequency difference (unless they have synchronous or induction motors, as in many turntables and older tape recorders etc - newer ones usually have electronically governed d.c. motors so should be OK on 50 Hz). Just make sure that the transformer capacity is sufficient for the load. A cheap source of 1 kW transformers in Europe may be obtained from shops selling old 16mm projectors that used 110V lamps on 240V supplies.

Regards
Peter

It can be found on my homepage.

http://members.iglou.com/rsg0910/atstemu.faq.html

I'm going to get in contact with Richard Karsmakers about an update. I believe one is *WAY* overdue. I've been on vacation outa town, working as usual, and so on.

: I'm really not entirely convinced I'm configuring it optimumly as I
: can't get it to use the .vhd files- as soon as something is saved on
: there (like say AHDI) it cannot be used again.

That shouldn't happen unless you had it configured to look for the .VHD files correctly. The file I mentioned above should do it.

However, there is an error in the FAQ file, on the setup of the Gemulator INI file. In the last line, it should say 'magic tosfilename' rather than just 'tosfilename.'

: (do please note, my email address at the top of this form is wrong -
: I've not figured out how to solve this yet in tin: Correct address
: dh219@cam.ac.uk)

You can easily change it yourself, if you use a different shell program. You have to use the /bin/csh shell, and change your email from there. I forget the command to use, but your admin will help you out. I think the command is 'set,' and then go from there after it lists the stuff.

Why? I can't see why text files aren't getting through in binary
mode? In fact with the FTP clients I use I'm always in binary mode, it's
set like this in my startup configs. If it's only a matter of CRLF vs LF
end of lines, you could convert the files before upload.

>Is there another program I might try?

NOSes FTP client uses PORT command, and can use binary or text mode.
As it doesn't require a hard disc it seems to be made for you...

Bye! Bruno.

PR> Suddenly I can no more use the modules that usually "speak" to the
PR> modem: CabDload, CabCheck, CabSurf are launched normaly but do not
PR> sent anything to the modem, with any of the ovls.

I've got it, at least for the ovl 1.2618.
BTW, I use it with GlueStik, not with Stik itself, this was perhaps the
problem.

According to the ovl doc, I have setup the NNTP_HOST which was supposed to
be passed to Cab but was only confusing one programm or another. Removing
this line in default.cfg solved the problem.

BTW, I also setup FULLNAME (not documented) to avoid having "your name" in
place of my real name with the 'mailto:' feature...

I guess you can order it from Computer Direct. If this doesn't work, try
System Solutions (not in the US, of course).

2804. JRI GENLOCK for sale

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-24 00:00:00 UTC
From: glenzabr@xmission.com
Message-ID: <60biv7mjt1@news.xmission.com>
Source record: 15789

I have an internal genlock device for sale for the MEGA ST 1,2,4 series computers. I believe it was manufactured by JRI years back. It has S-VIDEO in out, composite inout, 2 ST monitor ports(One genlocked,other straight video) control pad to adjust level of bluescreening etc... Ive pretty much just used this as a high quality video out to my big screen tv but it is collecting dust, along with my mega 4 in a box. Ill sell the complete computer with the genlock attached for $300 US + shipping . I'll include a monochrome monitor with the deal if you are in SLC, Utah and can pick up the computer yourself. Its a mega 4 , with the genlock device, higher quality PS installed(From best computers) , and it has a secondary fan installed in the genlock setup inside. For those unfamiliar with genlock devices, it allows you to overlay graphics from the computer over the video you feed through the device.

If you want just the genlock, ill sell this for $250

Email me for info or to purchase.

SUBJ: SCSI Hard Drive connection on atari ST

In a message of <23.09.97>, cyril.lorand@usa.net (90:102/0.99) writes:
cl> Questions 1 : My brother in lawn owns an atari ST and I'm trying
cl> to install a SCSI hard drive on it. This drive is a "PC" SCSI
cl> drive with a standard SCSI connector on it. From what I read in
cl> the different NG, it seems possible to install it on the ST but
cl> its DMA port (where it seems I have to connect the drive) is very
cl> different from the PC SCSI 1 connector. Does somebody have the pin
cl> to pin connection between those 2 guys ? Same question about a
cl> SCSI CD-ROM I'm about to get...

You need an interface, as the DMA bus is only a sub-set of SCSI. The ICD Link2 will do the trick. You'll also need a hard disk driver program (a good one comes with the Link). You can daisychain the CD-ROM to it, but will need a special driver such as ExtenDOS to address it. AS usual, only the last drive on the chain should be terminated.

cl> Question 2 : What is the difference between PC standard SIMM
cl> memories and Atari ST SIMM memories ?

AFAIK very little - except that the Atari ones don't need parity (but can use 9x chips).

cl> Question 3 : Where can I get the last version of TOS (I read it's
cl> 2.06), so he can use 1.44Mb floppies ?

Try Best Electronics (bestelec@concentric.net) or Computer Direct in Canada (info@compdirect.com). Actually you don't /need/ TOS 2.06 (though it is a great improvement) to use HD disks, but you do need a small hardware mod to double the clock rate to the controller chip (and possibly to change this to an Ajax in place of the existing Western Digital) and to use a small program to change the step-rate. You may alos need a formatting program for them, such as FCopy (though the Atari will read disks formatted on the PC).

Regards
Peter

> And there's no way I could put notebook parts in it..?..?..

It might have been OEMed by Atari in which case you would have to try the original manufacturer.

Back in those days, notebooks were designed from scratch for every model. There were very few common parts even within a single manufacturer, let alone between companies. This is very different from the desktop world where most parts are common.

Well, around *here* it is, as we dont (in general) use PC compatible
machines, but TOS based machines. This does not mean that a PC supplier
wont be able to help.

> And there's no way I could put notebook parts in it..?..?..

Dunno - having never seen one, I cannot say... but take it to a PC repair
store etc. and see what they say (it probably contains many standard
PC components which you can replace easily...)

Note, however, that the ICD Link according to my knowledge doesn't
support initiator identification. This means that you can't use certain
drives like the Quantum Fireball with it. These drives only work with
the LINK96/97.

2812. Atari monitor - is it dead???

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-25 00:00:00 UTC
From: Daniel Woodard <woodardd@dma.org>
Message-ID: <60dm4cihd2@sally.dma.org>
Source record: 15649

I saw what appeared to be an Atari ST monitor at a thrift store yesterday, so I plugged it into a wall socket and watched it power up. Then I fiddled with the brightness control, hoping to get the screen to blaze white, just so I knew it was working. Nothing happened. I could hear the monitor making that high pitched squeal that all monitors make when they power up, but I couldn't get anything on the screen. Do you actually need a signal from an Atari computer to get anything, or is this monitor broken?

Dan

I bought an external keyboard kit for my Falcon, it works great.. but I was curious if anyone knows the maximum length of cable I can run between the keyboard and CPU? I wanted to put the CPU in another room from my music studio.

It seems to use a standard 5 pin DIN (MIDI) cable, so before I run out and get the necessary adapter, does anyone know?

Thanks..

-Mark

The screen is completely black until the computer is turned on, so
you need the computer to test the monitor.

Wow, I thought there would be a lot of interest in this.. maybe some
people missed it?

(repost)

-LineAudio Jam-8 OUT audio output expander for the Atari Falcon.
Features 8
balanced line level, super high quality outputs compatible with any
Atari or
C-lab Falcon and Cubase Audio, Logic Audio, Zero-x, Audio Tracker, etc.
I'm selling it because I need to buy an ADAT interface instead for my
Falcon. It's in perfect condition and has never left the sanctity of my

home studio! I paid $450 for it, would like to get $350 for it, but I
will take the best offer (or trade for the Falcon ADAT interface). If
you don't think it's worth that, please make me an offer of what you
think it's worth.. I'll definitely consider it!

There's no such thing as 'PC' SCSI. SCSI is a standard on it's own,
whatever platform you're running.

> SCSI connector on it. From what I read in the different NG, it seems
> possible to install it on the ST but its DMA port (where it seems I have to

>

I'm afraid what you need is a SCSI host adapter. These little things are
sold commercially, look for ICD's 'The Link II' or 'Link 96/97'. There
is no pin to pin connection, as the signals have to be converted and go
through something a bit more complicated (PAL's and stuff).

> Question 2 : What is the difference between PC standard SIMM memories and
> Atari ST SIMM memories ?

First of all, only STE's and MegaSTEs take SIMMs, Anything else (ST,
STF, STFM) will need an expansion board to use them. Of course, we're
talking about the older 30 pin ones.

Otherwise PC SIMM's use parity (9chips), ST's don't care about parity (8
or 9 chips). So you can very well use PC SIMMs in the STE (1Meg, <120ns,
30 pins)

>
> Question 3 : Where can I get the last version of TOS (I read it's 2.06), so
> he can use 1.44Mb floppies ?

TOS 2.06 can probably be bought from several Atari dealers in the US.
Can't tell you much more about them.

To use HD floppies, you need to change the drive and perform a few
hardware mods, some quite complicated. TOS 2.x has nothing to do with
it. Check out Hallvart Tangeraas' home page or my Quick FAQ about that.

2821. ST Memory upgrade board questions...

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-25 00:00:00 UTC
From: williams@mustang.ecsel.psu.edu
Message-ID: <60esho$r2a@r02n01.cac.psu.edu>
Source record: 15658

Hi. ST newbie here again...but I'm beginning to feel more and more
comfortable with the ole bugger...

I've recently acquired a memory expansion board, but the owner of
the board didn't know what kind of RAM goes on it, and thus, the board
is empty.

The specs are as follows:

On the top-left corner is written

tech-specialties Co.
Houston, TX
520A, r211

32 slots for 20-pin chips

My 2 big questions:

1. What kind of RAM
a. Where can I get it?
2. Can this go into a 1040STf?
a. Anyone have the time to email me some simple instructions?

Many thanks,

Ken
williams@ecsel.psu.edu

2822. New Lower Atari Prices!

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4. (2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs or E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an order of enough of my stock. One example, a customer ordered over $200 of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125 Mono Monitor with a Built in Monitor stand and an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive plus a modified 800xl with a built in Translator on a switch that will run older Software without a Translator Disk Plus Lots more new 8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

2823. Re: NOS command line useage...

(Ronald J. Hall) wrote:

>
> Is it possible to use NOS without Oasis?

Certainly. The two have no connection to each other!

>What I'm getting to, is it possible
> to control NOS for E-Mail, Newsgroups, etc, from a command line

Sort of. It might surprise you to hear that Nos was around before
Oasis. Nos in fact comes from a package called Ka9q which is available
on demon's website. All oasis does is replace the "dos" front end in
Ka9q with a Gem one. I in fact used Ka9q for a few days until I heard
about oasis!

>so that my BBS software could control it?

Definately possible but you'd need to be able to program or have some
powerful tools. The complete source code for Nos is available and will
compile with Lattice although I don't think this is the best approach.

>Or is this more work than its worth?

Dunno what you want to do really, you'll have to investigate a bit.
This might help you decide ...

Outgoing news and emails are stored in spool\mqueue as simple text
files. The only formatting required is that they have the required
headers. Each email has a corresponding .wrk file which again is plain
text, typically only three lines. This is passed to the mail server to
tell it where to send the corresponding email. News is the same but
uses a .nwk file so Nos knows to give it to the news server and not
the smtp server!

Incoming news is stored in one great big text file called article.txt
in spool\articles - you can see this if you stop oasis automatically
unbatching.

I forget where incoming emails are stored. Offhand I think its
spool\rqueue. Have a look in there before oasis processes new emails.

Basically you only have one problem - a big text filtering job.

>Thanks in advance...! :)

Hmm, if each caller had a copy of oasis (ie no Nos) ...

You could filter out their subscribed newsgroup articles and email into a zipfile, which with suitable attributes, could expand into their "dummy" spool folder after they download exactly as though they'd just been online themselves, whereupon they could use oasis to unbatch the news and email. In the other direction, all they need do is zip up spool\mqueue and upload them, at which point, you have another filtering job to merge them into your real spool\mqueue folder.

I've had this happen back in my atari days and what i did usually worked. I would take a scsi hard drive that absolutely would refuse to be seen by the atari and i would place the drive in my IBM with an adaptec 2940 scsi card. I would then boot and do a low level format with the scsi cards low format routine built into the adaptec. This would usually reformat certain parts of the drive that the atari was choking on and would allow me to place it back into the ST and low level and partition it there. you could do the same by using a mac and then back to the atari

FALCON BASED DIGITAL AUDIO RECORDING SYSTEM

In excellent working condition. Check carefully for the items. They are good and the best on their category! This system works fine and you will be able to produce your music in the digital domain. Whether sequencing or audio editing, it performs fine.

1. Falcon 030 with 16 MB RAM. All required Steinberg audio & timing fixes have been done. Line level audio in.
2. 2.5' 60MB IDE Hard disk
3. Wizztronics DEKA interface for using external keyboard
4. Honeywell keyboard
5. Beetle mouse
6. SCREEN BLASTER II (for higher screen resolution)
7. Wizztronic Cart Master LIte (allows plugging in two cartridges at once) (for Cubase and Zero-X)
8. Monitor adapters for VGA and Atari Monitors.
9. Steinberg FDI (DSP PORT Digital interface for digital recording: DAT; CD, etc.!!)
10. External 1GB SCSI (no thermocalibration) Seagate hard disk.

SOFTWARE:
(all are original disks & include manuals)
STEINBERG'S:

1. Cubase Audio V2.06
2. Studio Module
3. Cue Trax
4. Style Trax
5. Data DAt (for backing up files to DAT)

---

6. Zero-X (Superb sample editing program)
7. BAnd-In-The-Box
8. ExtenDOS PRO 2.4a (CD-ROM driver with direct CD record to hard drive)
9. HD Driver 6.0 (Best Hard Disc manager for Cubase Audio)
10.ICD SCSI PRO Utilities 6.55 (covers things not handled by HD Driver)
11.XBOOT (Wonderful program launcher)
12.Diamond Edge II
13.Diamond Back III
14.Steno
15.Stalker
16.Image copy 4.0
17.CD-ROMS & MORE software.

Price: $ 1350 OBO./ No hard disk $1150 Repply to fpinto@byu.edu for more details. Phil.

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-27 00:00:00 UTC
From: Yves Pelletier <ypell@CAM.ORG>
Message-ID: <Pine.GSO.3.94.970927121734.22177B-100000@Stratus.CAM.ORG>
Source record: 15665
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

Hello MiNT programmers/users...

I am in the process of collecting patches for PL48 of the MiNT library. If you have been working with PL46 or PL47, and made modifications that are of general interest to the users of the library, why not have your contribution become part of the public release?

If you do not subscribe to the MiNT mailing list, and are unaware of changes since PL46, please dowload PL47 at funet.fi or ftp://ftp.cam.org/users/ypell, and verify that there is no duplication of effort between previous patches and yours.

Thanks

Yves Pelletier

2835. Changing Dating of a file from C-code

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-28 00:00:00 UTC
From: psloth@post2.tele.dk
Message-ID: <342e2fa3.3064690@news.uni-c.dk>
Source record: 15670

Please help I have a problem !!!
I am working on a disk to disk backup program.
At this moment I get the source file information by the function call
Fsfirst(DTA) and Fsetdta(DTA) where DTA is the adress of a buffer
containing information about Filesize, Attributes, Time and Date ect.
Then I copy the files I use Fcreate and therefore the copyed files has
todays date and time (like it have to be). How do I now change the
copyed files date and time so the dating of the source files can be
"copyed" to the the new files???

Thanks psloth@post2.tele.dk

Not trimming, cause I missed the in-between posts, (but found them on DejaNews).

I speculate that PKZIP crashed in parsing the file names for some sort
of final directory totals or something ... who knows exactly, but
not many programs can handle that many individual files (about 6300).
It may just have been a conflict with QEMM7.5 .. I do have to use
the PKZIP switch to turn off 32 bit DPMI usage as a mater of course.

I mostly wanted the PkZip file as a means to save redundant backups easily
(it takes too long to do anything with 6300 files individually).
I've got it done, and have the files individually on the Zip disk.

My experience with these PSUs has been miserable!! They are repairable
of course but IMO can lead to much grief!!

Why not search for a second hand PC PSU of around 200 watt. These are
usually very reliable and easily able to supply a lot of equipment.
You will need to revise the plugging arrangements but for a small
expenditure will end up with a more reliable system.

2839. Help with memory expansion board!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-28 00:00:00 UTC
From: williams@mustang.ecsel.psu.edu
Message-ID: <60mlok$12ts@r02n01.cac.psu.edu>
Source record: 15674

Hi. ST newbie here again...but I'm beginning to feel more and more
comfortable with the ole bugger...

I've recently acquired a memory expansion board, but the owner of
the board didn't know what kind of RAM goes on it, and thus, the board
is empty.

The specs are as follows:

On the top-left corner is written

tech-specialties Co.
Houston, TX
520A, r211

32 slots for 20-pin chips

My 2 big questions:

1. What kind of RAM
a. Where can I get it?
2. Can this go into a 1040STf?
a. Anyone have the time to email me some simple instructions?

Many thanks,

Ken

2842. Falcon 3,5" IDE questions!?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-09-29 00:00:00 UTC
From: Vincent Bakker <bakkerv@pi.net>
Message-ID: <34301698.30E7@pi.net>
Source record: 15677

Hello guys,

last week I tried to connect a 3,5" IDE disk to my falcon, using a standard 2,5 to 3,5 adapter (you know the ones that they use to put 2,5 drives in 3,5 systems).
Tried two different IDE disks and all possible jumper settings, but i wasn't able to let the hd driver see the IDE disk; and then I mean the driver persisted to claim there wasn't _any_ IDE device attached to the bus.

This all wouldn't be too hard, if it was not that I had intended to replace the internal 84Mb IDE with a 1,8Gb 2,5" IDE, but now I'm very affraid there is a big chance this won't work either so I have put that plan in the hold.

thus, the following questions arise:

Q: why doesn't it work?

More specific Q: do i need a special driver to use other than internal IDE? Is the 2,5 to 3,5" adapter a wrong one? are there only specific IDE drives that function correctly?

Irrelevant but still interresting Q: with some master/slave jumper settings on the IDE the floppy didn't function anymore; i can't see how is this possible!?

any help or info greatly appreciated.

greetz,
Vince

I've seen fuses that look like surface mount resistors, as well. I think
it's technically a 0 ohm resistor that blows at a certain current.
They're more like 2 X 3 mm.

Lessee, no source, no substance, no reply address.

Oh yeah, _there's_ a credible accusation!

ICD has never given me a moment of doubt. Even when I ordered an Adspeed STe at the Glendale show when they didn't even have a working final version on hand! Sure enough, 2 months later, there it was in my mailbox. Blew up an AdSCSI+ that was a very early version. They fixed it. Had a problem with getting a Link I to work with a hard drive, they promptly responded to e-mail on how to get it going.

Personally I can't wait for their PC capture card. Animation captures for the price of a Snappy. And it should work with a 486DX4!

Dan

This is nonsense. What is called "Low Level Formatting" on the PC is
nothing else the usual Atari software does when formatting a hard disk
drive. Either you format a drive or you don't. There is only one way to
format a drive, not several like this strange term "Low Level
Formatting" indicates. The formatting software send the FORMAT command
to the drive and the drive does the rest. The result is always platform
independent. Only when creating file systems by partitioning the drive
or by using the DOS "format" command you get a platform dependent
layout.
Have a look at the SCSI-2 specification, it's all explained there.

>I use HDDriver..

I use the patched AHDI version (6.06u) on my Falcon with the AB040/Nemesis
and one 1.08gig Toshiba IDE and a 4.3gig Microp AV drive. Works fine if I
don't load MiNT. If I do the SCSI drive gets screwed up, so I'm waiting
for HDDriver 7.0.

Rich

Does the disks work on other systems? In that case it looks like you've
wired something wrong. Or perhaps you still have the original 2.5" IDE
connected and it doesn't work with more than one device on the bus. You'll
never know...

BTW: what driver do you use? You'll need either HD-Driver or Hushi
(SCSI-Tools driver) if you have more than one IDE-device, AHDI won't work.
I've heard of a patched AHDI that works with two IDE-devices but I have
never seen it.

> More specific Q: do i need a special driver to use other than internal
> IDE? Is the 2,5 to 3,5" adapter a wrong one? are there only specific IDE

All IDE-drives should work fine, regardless of size and make. The adapter
should work fine (I have one myself), if you've connected it the right
way that is...

> Irrelevant but still interresting Q: with some master/slave jumper
> settings on the IDE the floppy didn't function anymore; i can't see how

The disk (Seagate) worked on a PC and it was at testtime the only hd
connected (boot from floppy). I tried two different Seagate disks. Only
if I was able to let the driver see the IDE device, but couldn't access
it, I would be less troubled..

> BTW: what driver do you use? You'll need either HD-Driver or Hushi
> (SCSI-Tools driver) if you have more than one IDE-device, AHDI won't work.
> I've heard of a patched AHDI that works with two IDE-devices but I have

I'm using Hushi 6.09. Might a more recent version do the job?

There are only two ways to connect it and I guess I've tried them all :)
The wrong way creates all sorts of funny fxs.

But am I right in thinking that, due to the bus structure of IDE, an adapter that connects 2,5 drives to 3,5 controllers is the same as an adapter that connects 3,5 drives to 2,5 controllers?

The only IDE-drivers for Metados that I know of are the ones in CD-Tools
(from Hard & Soft in Germany). Julian Reschke's Spin.XFS works perfectly
with these.

> The disk (Seagate) worked on a PC and it was at testtime the only hd

Does SCSI-Tools see the drive? If it does you should try to partition it.
Don't format it!

I had a Seagate last week, but it seased working after ~12 hours... I
can't remember the jumper-settings, but they are usually printed on the
label so try to set it to normal master.

> I'm using Hushi 6.09. Might a more recent version do the job?

I haven't used Hushi in ages, so I don't know. I used v6-something, and it
worked perfectly with two disks.

> adapter that connects 3,5 drives to 2,5 controllers?

Yup. 2.5" and 3.5" are indentical, except for the last four pins on the
2.5" which is used for power.

2.5" 3.5"

1 --- 1
...

```
40 --- 40
41 ---
42 --- Power-plug on the adapter. Ignore this.
43 ---
44 ---
```

Do *not* use the power from the 2.5"->3.5" adapter to power your 3.5" drive! I tried it with an old Seagate (my first #2 disk) and it didn't work at all. Take the power directly from the PSU.

>Irrelevant but still interresting Q: with some master/slave jumper
>settings on the IDE the floppy didn't function anymore; i can't see how
>is this possible!?

I don't n witch adaptor do you have, that works nice in some diffenrent falcons.
You don't need a nwe driver, if your driver found the old device.

Remove your adaptor, connect your 2.5" device. Your falcon will found that IDE?

Next point is the jumper setting. If that ist you only drive, set as 'master'
If you have two devices, set the second on as 'slave'
That's a MUST.

If you conncect your 3.5" IDE, you got any response while booting the system?
If your machine can't found that device, somthing about your flat cable / adaptor is wrong.

Best results with IDE drives i got while using HDDriver6 -> 7

Do you connect that 3.5" device to the internal psu!?
Remember: Falcon's PSU only have +12V with an current of max. 300mA !!
That'd not enough for a lot to 3.5" IDE Devices..

Use a extra PSU

Take a short snapshot from DOITF030:
(Your found a list of some (cheap) 2.5 Devices)

Manufacture Typ Space Size

Hitachi DK222A-54 540 MB 2.5"
Hitachi DK212A-81 810 MB 2.5"
Hitachi DK212A-10 1.0 GB 2.5"
Areal MD2085 80 MB
Fujitsu M2637T 240 MB
Conner CFN250A 250 MB
Conner CP2064 64 MB 2.5"
Quantum Daytona 500 MB
Seagate ST9077A 2.5"
Quantum Europa 1.08 GB 2.5"
Toshiba MK1002MAV 1.08 GB 2.5"
Toshiba MK1924FCV 540 MB 2.5"

But i'm sure that list will be a lot longer....
Few month ago i take 540Mb for around 170 DM, so i don't need a 3.5" device ;-)

Have a look to your adaptor..
Don't plug in your IDE i a wrong way!!

Regards, Robert

> "copyed" to the the new files???

The Fdatime() function is the one to use. The format is

for C:
void Fdatime(timeptr,handle,flag)

(or in assembler)

move #flag,-(sp)
move #handle,-(sp)
pea timeptr(pc)
move #$57,-(sp) GEMDOS code for Fdatime
trap #1
lea 10(sp),sp

where:

timeptr is a pointer to get/put the time and date in GEMDOS format
handle is the file handle
flag is to pick read (1) or set (0) the time

The best way to use it would be

Fopen(src_file,read_flag)
Fcreate(dst_file,attributes)
Fdatime(temp_buffer,src_handle,1) /* to read date/time */
Fdatime(temp_buffer,dst_handle,0) /* to set date/time */
..
/* the copying code goes here */
..
Fclose(src_handle)
Fclose(dst_handle)

How about Fdatime()? You can get the date/time stamp from the old file with
it and write it to the new file.

A friend of mine has purchased an ATARI PC3 computer (second hand) with no manual or discs. The operating system is MS-DOS 3.3 and the chip is an 8086 - I know it's old - but he cannot afford more.

The problem is that the machine has all German operating DOS system and a German(?) keyboard.

We have loaded in an english-language version of 3.3 and that sorts the keyboard (although the keys are now wrong) BUT the DOS messages are still in German.

We reformatted the hard disc and that made no difference 9or has it?)

The answer HAS to be YES!

>If so, where can I get drivers for
>That's Write Three, Timeworks Publisher and Calamus?

I guess you just use the standard Epson LQ drivers. There are a lot of
people who say "I can't find a driver for my XXXXXX printer" - well,
they won't!! The name on the printer is just a badge - the actual
printer protocols almost certainly include "Epson LQ" with, perhaps
"IBM Proprinter" in case you want to use it.

Look in your printer manual to see which modes it emulates and set the
DIP switch to whichever you prefer. You'd be best going for the
"Epson" emulation as EVERY program will have a driver for this type.

I tryed to use (succesfully) the SPIN CDrom driver for MagiC that came by FAN, and it worked immediately for me better then extendos.... after some time, casually reading the german documentation (I cannot read german) my eyes encountered the words Apple HFS..... so I just had a flash and tryed putting a Mac CD in the drive..... IT WORKED ! All mac files, with long filenames were available, unbelivable !

Sorry, I was so surprised I had to report here ! The only thing needed would be an auto-easy-GEM-mounting/unmounting of CD volumes, like you do on the Mac with CD Toolkit, but this may be limited by the MagiC environment.

That's a PC and this is an Atari ST newsgroup. You'd probably be better
off asking in comp.sys.ibm.pc or something like that.

I don't know about these programs, but normally GEM software should use
GDOS for printing.

The Epson Stylus colour driver included with NVDI does not work properly
with the Stylus 400, unfortunately - it works fine in 360 DPI mode, but
not at 720 DPI. Apparently NVDI version 5 will include a suitable driver,
however.

I contacted Epson regarding obtaining documentation to make the necessary
driver, but they only offered to sell me a thick book detailing the
operation of the entire range of Epson printers, and this was much too
expensive...

Well I have my doubts about this, as the Trammels were never noted
for wasting money in design. The reason I asked the question was that
I had trouble reinstalling LINUX, The diagnostic cartridge showed no
problems. I checked all the SCSI stuff and found some configuration
errors! I terminated the Internal HD drive and removed the TT internal
resistors (I kept getting errors using GTAR).
The external SCSI chain is correctly terminated.

The problem dissapeared when I removed the TT memory card (GESOFT).

It is now working with the internal TT resistors removed.

So my next question is about the GESOFT TT memory card. I have had no
problems running with it under TOS and the diagnostic cartridge shows
no memory errors. However when starting from cold I sometimes have
problems during boot, as the keyboard repeat key/mouse movement
cause multiple interupts, have to power down and restart to clear.
Any answers on this one?

2883. Questions about ST Hardware

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-01 00:00:00 UTC
From: pls@no.spam
Message-ID: <60tdqv$7f9@bcrkh13.bnr.ca>
Source record: 15718

I have been doing some serious examination of the ST internals & I have reached some conclusions; I wonder if anybody else agrees.

From my observations the ST DMA chip is not a true DMA controller, it cannot work independantly; it needs the GLUE & MMU to work.

This makes it very different from other general purpose DMA controllers, it means the ST system is very tightly coupled & the GLUE chip is probably the most important device (after the CPU that is).

It seems to me, the DMA registers must be located in DRAM memory, ie the DMA counters are actually a location in the DRAM chips, as opposed to a register in the DMA device itself.

Anybody else agree?

The Video base address counter must also be in main memory.

These registers could be located somewhere in low memory & the GLUE could remap them to appear elsewhere.

This technique would have saved chip space when the ST designer was trying to keep costs down.

There are some hardware registers 'shadowed' in main memory though, mainly the Shifters configuration.

Source record: 15719

Hi!

Have anybody tried the VMG-Generator in NVDI ET4000 on a machine with a 040 or 060?

I have NVDI ET4000 installed on my Falcon (no graphics-card yet), and it works fine, but when I tried to test the VMG-Generator today it bombed out. It worked fine before I installed the Afterburner.

Jo Even Skarstein

Hi,

My friend has turned his interal harddisk inside out but no fuse.
To avoid any confusion I'm speaking of an internal harddisk of a Mega
STE (type TT030). I believe it's a Seagate ST-157N and AFAIK it's a
ACSI harddisk.

2889. FS: Nemesis+Videlity, new, cheaper!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-01 00:00:00 UTC
From: tomo@fly.cc.fer.hr
Message-ID: <60umnn$7om@bagan.srce.hr>
Source record: 15724

Hello!

I offer my Nemesis + Videlity bundle for sale. I got them in
April. I never installed Nemesis (I hardly ever looked at it), but I
registered Videlity to my name. I'd like to sell those together, but that
will mostly depend on the interest people will show for it.

Prices are 70% of the original ones.

NEW MY OFFER

Nemesis 52.50$ 37.00$

Videlity 14.95$ 10.00$

Although I live in Croatia, the postal costs to anywhere on Earth
will not exceed $10.00. Buyer also pays the bank charges in case of bank
transfer - $6.00 tops. Remember you have to pay that to Titan also if you
buy directly from them.

Please, reply directly to my email: tomo@fly.cc.fer.hr, I don't
check this group very often lately.

Greetings to all!

Tomislav

> about 2 hours aday .

Yes, but Robert says the problem is with the 12V line... Power suplies have an overall power rating which is broken down into so much current at +5V, -5V +12V and -12V. Unfortunately, you can't share power on a different voltage. A 3-1/2" hard drive will draw much more 12V power than a 2-1/2" will (as a matter of fact, I'm not so sure the 2-1/2" drives draw _any_ 12V).

For example, I have a TT with an 8 meg ST ram card, a 16 meg TT ram card, a CaTTamaran, and a Nova card. If I put a hard drive in it, it goes unstable. I believe I'm drawing too much current under 5V and very little under 12V.

I assume you mean with _another_ SCSI drive. The 157N is a SCSI. There are a few drives you can't use which I'm sure there's a FAQ on (and the MSTE owners will enumerate). If it's your boot drive, it can't be a Quantum Fireball or IBM DALS drive. They require bus arbitration and from what I understand, you can't get arbitration until you boot a drive and let HDDriver or the like set it up.

> What is needed?

The ST-157N _is_ a SCSI drive. He can replace this drive by another SCSI drive but only if this drive:

1. supports switching off parity checking (with a Jumper for example)
2. doesn't require initiator identification (e. g. the Quantum Fireball series)

Your friend can connect any SCSI drive to his Mega STE if he uses a third party SCSI hostadapter like the LINK96/97. (There is an external as well as an internal version.) The LINK96/97 supports parity as well as initiator identification.

Basically this is correct but only applies for Falcon and TT SCSI.
Concerning an ST/STE the SCSI hostadapter has to care for initiator
identification (not bus arbitration, this is a step further and is not
possible at all with an ST/STE). Initiator identification supplied by
software like HDDRIVER is only possible with TT and Falcon.

> in the DMA device itself.
If the registers were stored in DRAM, then either the memory available to
the system would be reduced, or it would be possible to access the
registers somewhere in the lower part of the address range - neither of
which is the case.
In my opinion the registers are held in either the GLUE or MMU chip - the
former being the more liekly.

> The Video base address counter must also be in main memory.
The shifter only appears to have 5 address lines, so I can only conculde
that these are used to specify an offset from the base address, and that
some other chip does the calculation to work out the actual memory
address.

It is interesting to note that the base address can only reside inside the
lower part of memory, i.e. only where there is actually any ram. Setting
the base address to the I/O address range, or even into the ROM address
range produces constantly changing giberish on the screen.
This suggests that the shifter accesses memory via the MMU chip rather
than via the GLUE, and that the MMU chip stores the shifters registers.

I've been following this thread pretty closely, both as a past ICD
customer and a potential future one... I now have to say that I can't
in all honesty trust what you are posting. Why? Okay, lets define the
reasons, shall we?

1) You won't identify yourself (show us your real name!)
2) You won't give actual instances with real names so that
we can verifiy them.
3) You constantly attack those who question your posts.

I'm constantly amazed (and disappointed) when I see a reply like yours to
Nick's message. Slandering someone's origin? Geez, grow up and get a life,
okay?

I suppose now, that I will be attacked also... Here, let me help you-I'm
from Eastern Kentucky... (so far up in the hills that the Saturday morning
cartoons get here on Sunday!) Have fun.

Yes, of course. The 157N is a SCSI device anyway (the "N" signifies
this for Seagate).

Best to look for a bigger Seagate (577N?) with the same physical
profile so it's simple to fit.

Just substitute for the one which is there. Check ID setting (0) and
termination (ON).

>>info would be helpful.

They are the same power supplies you can find in ST's with internal power supplies. The only difference seems to be the mounting bracket and the "filter" on the MegaFile where the power cord goes.

If you can get a good working ST power supply, you can remove it from the ST bracket and install it in the MegaFile bracket with a bit of soldering. Watch out for some of those voltages!

Hope this helps,

Randy Kwak

2905. Watch out for ICD. Several reports that they are scamming people!,

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-02 00:00:00 UTC
From: no.sp@m.com
Message-ID: <3437fa27.437836@news.flash.net>

I suppose that was meant to be an insult based on nationality. You're
right to say that you come from the US where there is a constitution (we
have one too, by the way). So go and read it, and if you have a greif
against ICD, take it to justice.

Now this is being forwarded to postmaster@flash.net.

Good bye

I, and many other beleive you are someone who is accusing a legit and
supportive company (at least from what I can tell) basing your
allegations on absolutely no facts and no names. Maybe here in France we
eat long bread, cheese and wine, but we have laws against diffamation.

Cross-posted to: or.forsale,pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

Find Lower Prices @ http://www.teleport.com/~bensmith/bscomputers.shtml

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

I'm looking for certain Items for my Atari. Item (1)Mega 4 ST. Not a Mega 2 ST upgraded to 4 Megs. I need a Mega ST with 4 Megs of RAM Populated at the Factory. A real Mega 4 ST, preferrably with TOS 1.4. (2) I'm also looking for a Canon IX-12F Flat Bed Scanner with a Navarone Cartridge & SoftWare. (3) I'm looking for CatBoxes for Atari Jaguar, as well as Jag Controllers, Jag-Links and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs or E-Mail: bensmith@teleport.com

In some cases I'm willing to discount a sale if the Buyer makes an order of enough of my stock. One example, a customer ordered over $200 of software. So I discounted his order %25.

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125 Mono Monitor with a Built in Monitor stand and an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive plus a modified 800xl with a built in Translator on a switch that will run older Software without a Translator Disk Plus Lots more new 8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,

Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports

on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

There was not one single allegation in ANY post I posted. And dEfamation (as in defamation of character) comes when one makes allegations that are proven to be false and thereby damages an individuals reputation. Which since I made NO allegations but, instead related my opinion based on what I heard from others who I consider to be not ALL lying to me (for no reason at the same time) is not defamation.

Next time you decide to make an ass of yourself you might try at least knowing the definitions (and spellings) of the words you are using to do so.

Of course I do, otherwise why did I upgrade from STFM. I use it for program development & expense tracking only. I play games on another platform (let's stop here).

The registers do not take up much memory, & the system does use some memory for itself, you don't get the full 4 MBytes for programs.

Are you sure it is not possible to find the registers in memory?

I found some locations that were updated regularly near the video base address.

>In my opinion the registers are held in either the GLUE or MMU chip - the
>former being the more liekly.

The GLUE does have some registers, eg. the 50/60 Hz selection register is here. AFAIK, the GLUE does not have the full dat abus (16 bits) available to it. Makes things very difficult if the registers were here.

The MMU also hase some registers, but it also has all of the DRAM. It would be easy to use this for storage. The MMU only has a 4 MByte address range, while the registers are way above that.
>
>
>> The Video base address counter must also be in main memory.
>The shifter only appears to have 5 address lines, so I can only conculde

Yes, I think the CPU puts the address into the register, but I don't
think these address lines are for the video; 5 bits is 32 locations, not
enough as the screen is 32K in size.

Maybe the address lines are for changing the colour pallette.

>
>It is interesting to note that the base address can only reside inside the

>than via the GLUE, and that the MMU chip stores the shifters registers.

This is what I am saying, but I believe the registers are in DRAM.

It's probably more true to say the MMU & GLUE control the shifter. The shifter
is a very simple chip, it has a serial data line from the MMU. The MMU clocks
data into the shifter from main DRAM. Video syncs are generated by the GLUE.

Glue controls the MMU & Shifter.Vsync from the GLUE tells the MMU that a
display line is being scanned.

2917. STE to SCART

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-03 00:00:00 UTC
From: Philip Young <c96py@dmu.ac.uk>
Message-ID: <3434D71D.41C6@dmu.ac.uk>
Source record: 15602

OK does anyone know how I can link my STE to the SCART port on my TV?

I think it is posible as a seem to remember silica (now shut down)
selling an ST to SCART cable at one time.

If anyone knows somewhere that can supply the cable then that would be
great. Otherwise a circuit diagram would do.

Please reply to:

c96py@dmu.ac.uk

Thanks.

MB> A friend want to know if it's possible to replace his dead Seagate
MB> ST-157N internal harddisk (Mega STE) with a SCSI drive.

All SCSI-drives should work fine in a MagaSTE.

MB> What is needed?

1. Parity-checking should be disabled. If there aren't any jumpers you can use
for setting this option you should configure it on a PC oder TT or Falcon.
2. Be sure the SCSI-ID is Unit 0, because the internal SCSI-controller of the
MSTE can only handle ID 0.
3. You should remove the terminators.

MB> Thanks

You would probibly need to consult with the software publishers, unless
there is an option to make your own drivers in the software.

Yes. They were even sold with this cable in France, as the SCART
connector is mandatory on all TV's sold here since 1981. For that reason
French STFM's and STE's don't have an RF Modulator, since the SCART
solution is cheaper and better (it's directly RGB)

>
> If anyone knows somewhere that can supply the cable then that would be
> great. Otherwise a circuit diagram would do.

The ST monitor connector pinouts can be found here

http://www.teleport.com/~atari/STinternals.htm

The SCART/Peritel pinouts are standard. I know I found them on the web
at one moment, but I don't remember where. I think good old Yahoo should
get those.

Once you have the pinouts, just connect all outputs to the corresponding
inputs. Do not connect the monochrome detect pin.

I have a GOOD report regarding ICD... One of my friends (although neglected in the area of communication from ICD) did eventually get their order. They are still upset about the length of time it took and the fact that they received no replies to the inquieries but, atleast they don't feel ripped off.

I now believe that perhaps the problem with ICD lies in the area of poor management and not scamming. Best advice if you are going to deal with them is to use a credit card or COD so you have a buffer or recourse against such abuse.

-Just keeping those with enough common sense to take advice updated.

The rest of you can stick it...

Hello,

Before some time I've searched information about connecting the ST to an Ethernet (in my case: Mega 2 ST, and i have Twisted pair in the room). I found some solutions, but they seemed to be much more expensive than byuing a second-hand PC with an Ethernet card.
What about adapting an existing ISA controller for PC's? They are to find everywhere and they are much cheaper.

Gentcho

I suggest you to look at the Volksfarben project that was
a ST MEGA bus slot to ISA slot bridge. It was meant for
et4000 ISA cards but can be adapted to support other
types of cards (ie changing IRQ).

You made allegations, that you yourself proved to be false in a later
message, damaging ICD's reputation. The fact that you start all you
sentences with 'I think' does not make that an opinion.

If I say 'It is my opinion that you are a Nazi criminal of war', I'm I
not making false allegations and damaging your image ?

> | >Next time you decide to make an ass of yourself you might try at least

2937. Help needed connecting VGA Monitor

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-05 00:00:00 UTC
From: robbie@lilac-room.demon.co.uk
Message-ID: <3436dfca.2246286@news.demon.co.uk>
Source record: 15622

I have a 1985 Atari ST with a monitor connection only. It has been quite severley adjusted and now has 4MB and I use it mainly for midi and haven't moved over to the PC as the PC version of Cubase is getting some severe criticism for timing problems and crashes. My SM124 has recently died and I have an old VGA (15 pin) PC monitor that I would like to connect. Is this possible and if so does anyone know the pinout to use??
Thanks for any information
Dave Robinson

>Thanks,
>
>Joe Mirando @ STReport

Joe, from what I understand, the "Burst" mode requires special simms
that can take the data in and transer it back out much quicker than
the standard "Fast Page" 30 pin PC/Mac simms can. I tried setting it
when I upgrade theTT I owned after the same upgrade you discussed and
it would just crash each time while trying to boot. I guess if your
simms can handle this, it's similar to the newer EDO simms or
something know where they are suppost to be much faster.

Mike

I think that it wouldn't work as the vertical and horozontal sweep rates
wouldn't match. You would need a multi-sync monitor, which will work fine
as long as you make a connector to match between the st and the monitor.
The ST uses NSTC (television) standard sweep rates for low and mediuim
resolutions and switches to a higher rate for High resolution, none of
which is compatable with VGA.

>Does anyone know how I can get my STe to 16 our 32mhz?

Easiest way is to add an ICD Adspeed accelerator, if you can find one. With the adaptor, its plug 'n play on the STe. Compatibility is good too, you can use the included software to downshift back to 8mhz for problem programs that won't work at 16mhz. (Spectrum 512 for example)

Its more expensive, but you can also add T-28 or T-36 accelerators, that make your STe run at 28 or 36mhz. Fast, but a little expensive... :)

It's definitely possible, but I don't have pinouts or anything to hand. Before anyone can answer this properly, however, it'd be useful to know the make (& rough age) of your TV - some TVs (Sony's, I believe) used signal levels that were not directly compatible with the ST, and the lead therefore needed some pull-up resistors in it.

Cheers,

Xav

Dr. Phlatus and W'h'eezer's creative interpretation of this analysis.
Platus has gone on to greener pastures. Sure the money may be better,
the benifits package a little more to his liking, but how can all that
make up for the fact that he's not going to be taken under the wing of
Ree Tard, who's vast technical knowledge the Doctor probably ripped off
during the interview to get this new job.

Once Again, the names have been changed....

_____ Forward Header
_____
_____
Subject: Re: Internet Explorer 4.0 problems
Author: Ree Tard
Date: 10/2/97 1:17 PM

I have heard this and seen worse things happen with IE40. In my
professional technical opinion, I would recommend that it not be
installed
at all (sniff).
Discouragement is not a strong enough word. But neither is moron.
This version of IE attempts to do many things that it probably
should not. Many things. Just many things. Lots. I mean TONS.
That it probably should not!
My personal experience came from attempting to install it on a
relatives computer against their will. I also did many other things
against their will but that is beyond the scope of this message. It
did install well, and things just weren't screwed up at all, so I ran
the uninstall program for it. This did prove to be a good thing
(snort). Because as soon as I did, I started having problems to fix.
Many people, like some OPS programmers that recently left [petty state
office name deleted], think that if something is working properly that
you should leave it alone and just be blissfully unaware of all the
problems that may surface if you try something like uninstalling a
program that's working perfectly and putting in an older version, for
instance. Well, thank God I'm not so short sighted and ignorant.
I installed another version of IE(3.01) and eventually the computer
ended up displaying error messages for a particular file. "Finally",
I thought. I knew that if I could go ahead and get all possible problems
to
occur BEFORE the new browser was in use that I would be able to solve,
or
attempt to solve, many more problems in a more timely manner. This file

was
directly associated with IE40; it served to link the dll stacks with
their
IPX drivers. The file no longer existed on the hard drive, yet the
system
was still trying to load the file. This was obviously because the dll
kernel had been loaded on the TCP/IP stack and had failed to handshake
with
the ALU registers.
Through much work and effort and numerous attempts to run scandisk,
defrag,
Virus Scan, and Resource Monitor I discovered a great number of
crosslinked and overthreaded files in the temporary internet cache
subdirectories of the main windows subdirectory of the C internal
storage
unit (huge sniff). Those rat bastards at Microsoft purposely set up the
uninstaller to leave a "scorched earth" trail behind it, rendering the
whole computer useless to any other browser, including one of their own!
The hard drive was in serious danger of needing actual reformating after
I
got done with it. The partitions were worn from repeated multitasking of
the internal drive IDE controller jumper pin settings which caused the
sectors to boot and the FAT to become allocated. This problem required a
full reinstall of Windows 95 and all of the ODBC drivers that I had to
painstakingly re-write in assembler.

IE40 is not worth the trouble, do not install it, unless you want ME in
your office.

I was writing ODBC drivers on my Commodore 64 when you was trying to
plug
in the joystick on your Vic 20, bitch!

Poppin' kernels off the stack like Gallileo dropped the orange,
Ree Tard

>
>Currently I have MiNT installed without MINIX with the init tools and
>have several UNIX-like tools available.

You would need to install and setup MiNTnet and install and
configurate httpd. That's pretty much it. I would strongly
suggest making a minix partiontion since a MiNTnet setup
needs some long filenames.

I know several ppl that have a working complete network
setup, ie teletd,ftpd,httpd,nfs etc, on MiNT even with
as little memory as 4meg and on STs.

Since I only have a PPP line to my Ataris I haven't
bothered to setup a complete setup on them though..

Regards
Sven

2957. Atari ST monitor audio question

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-06 00:00:00 UTC
From: ut13@rz.uni-karlsruhe.de
Message-ID: <34384cb02753606@rz.uni-karlsruhe.de>
Source record: 15499

Hi,

Sorry for asking once again, but I thing there waere no
responces on my previous question. I found some
circuit descriptions how to listen to the Atari sound
through an Hi-Fi amplifier or whatever. But I asked
about something different: in some books it's written
the Audio in is for sound mixing. Does anybody know
some parameters? May I just connect the output from
a casette deck (?) to it, ot I'll burn something up?
Or I should better use not the Audio in, but mix somehow
the two signals myself before sending to the monitor?
I want to listen the music from the monitor speaker.

Thanks
Gentcho

And as long as its capacity is less than 1 GByte. The STE hostadapter
only supports drives up to 1 GByte capacity. Larger drives work but only
1 GByte can be used. A new hostadapter like the LINK96/97 will solve
this.

Actually I think you _can_ use a straight VGA monitor in ST mono mode (640x400): but you need a special cable which synthesises a combined sync signal out of the separate horiz. and vertical ones the ST supplies. Mono would be fine, right?

I'd suggest asking (say) System Solutions if they have such a beast.

Could you please describe how these "wavy" lines look like?. I had a similar
problem due to a ground loop that made the GLUE produce wrong video timing.

Are some memory positions corrupted? In that case I would suspect EMI
or faulty soldering/ground.

>I don't know of any way to tell the ST that the memory above $400000 is alt
>ram, does it know this already? Is there some location, like the MMU

There are some Alt ram related system variables. Have you set them
correctly?

If you use MiNT the most easy solution would be to alter the mint kernel
since it handle all M(x)alloc's itself. Otherwise you can setup the
Alt-ram related system variables using a small auto folder program.

Author: Ree Tard
Date: 10/2/97 1:17 PM

I have heard this and seen worse things happen with IE40. In my
professional technical opinion, I would recommend that it not be
installed
at all (sniff).
Discouragement is not a strong enough word. But neither is moron.
This version of IE attempts to do many things that it probably
should not. Many things. Just many things. Lots. I mean TONS.
That it probably should not!
My personal experience came from attempting to install it on a
relatives computer against their will. I also did many other things
against their will but that is beyond the scope of this message. It
did install well, and things just weren't screwed up at all, so I ran
the uninstall program for it. This did prove to be a good thing
(snort). Because as soon as I did, I started having problems to fix.
Many people, like some OPS programmers that recently left [petty state
office name deleted], think that if something is working properly that
you should leave it alone and just be blissfully unaware of all the
problems that may surface if you try something like uninstalling a
program that's working perfectly and putting in an older version, for
instance. Well, thank God I'm not so short sighted and ignorant.
I installed another version of IE(3.01) and eventually the computer
ended up displaying error messages for a particular file. "Finally",
I thought. I knew that if I could go ahead and get all possible problems
to
occur BEFORE the new browser was in use that I would be able to solve,
or
attempt to solve, many more problems in a more timely manner. This file

was
directly associated with IE40; it served to link the dll stacks with
their
IPX drivers. The file no longer existed on the hard drive, yet the
system
was still trying to load the file. This was obviously because the dll
kernel had been loaded on the TCP/IP stack and had failed to handshake
with
the ALU registers.
Through much work and effort and numerous attempts to run scandisk,
defrag,
Virus Scan, and Resource Monitor I discovered a great number of
crosslinked and overthreaded files in the temporary internet cache
subdirectories of the main windows subdirectory of the C internal
storage
unit (huge sniff). Those rat bastards at Microsoft purposely set up the
uninstaller to leave a "scorched earth" trail behind it, rendering the
whole computer useless to any other browser, including one of their own!
The hard drive was in serious danger of needing actual reformating after
I
got done with it. The partitions were worn from repeated multitasking of
the internal drive IDE controller jumper pin settings which caused the
sectors to boot and the FAT to become allocated. This problem required a
full reinstall of Windows 95 and all of the ODBC drivers that I had to
painstakingly re-write in assembler.

IE40 is not worth the trouble, do not install it, unless you want ME in
your office.

I was writing ODBC drivers on my Commodore 64 when you was trying to
plug
in the joystick on your Vic 20, bitch!

Poppin' kernels off the stack like Gallileo dropped the orange,

Although there is an 'audio input' pin on the monitor connector, I've
never seen any application using it. I'm not even sure that it works. If
I were you, I would not try connecting anything to that pin.

They actually stock an STE to SCART cable? I know they have SCART cables but is it a dedicated STE to SCART cable?

BTW Xav, The TV is an ALBA and it's brand spanking new! (it's in Argos 130UKP)

It is posible, but only in ST high res. I asked the same question last
year and someone sent me a circuit diagram (sorry can't find it).

ftp://ftp.uni-regensburg.de/pub/freeware/software/atari/docs/hardware/vga_um.zip

contains something which might be helpfull.

Source record: 15643

I would like to know whether it's possible to configure a Falcon as a
(humble) HTTP server, using MiNT, the NCSA HTTP server etc.

If anyone has ever attempted to do this (with or without succeeding),
I would like to hear how exactly it's done. Do I need to install MINIX ?

Currently I have MiNT installed without MINIX with the init tools and
have several UNIX-like tools available.

I still have a few hardware bugs to sort out.

One of these is the 'wavy' lines that appear when the mouse is moved onto the menu bar & a new drop down menu appears.Some screen pixels are getting corrupted.

This happens to a lesser extent when a window is redrawn.I don't have a blitter installed.

Is the VDI copy operation particularly fast, or does it have some special way of reading/writing to memory?

>you could probably write a hack to prevent it from doing so, but why
>bother?

I was hoping to use this memory only for programs, I recently installed MiNTnet & find the lack of memory a problem. I was hoping to use the new memory for daemons & drivers, leaving the ST ram for programs that need it.

Until I solve the screen corruption, the new memory is of limited use.

One thing I did find strange is that a program called RAMTEST finds many errors in the new 4 Mbyte block, while my own memory testing routines do not.

Anybody familiar with the program RAMTEST?

Sysinfo reports a weird memory configuration, ie.

8192 Kbytes of ST RAM
3910346 bytes of Free ST RAM

0 bytes of TTRAM
4104657 bytes of Free TT RAM
8015003 bytes of used ST & TT RAM
Total ST & TT RAM 8192 Kbytes.

I don't know of any way to tell the ST that the memory above $400000 is alt ram, does it know this already? Is there some location, like the MMU configuration register that the OS reads for alt ram?

The processor *needs* an MMU chip before it can do anything useful, but you wouldn't say that it isn't a true processor, would you?

> >> This makes it very different from other general purpose DMA controllers, it
> >> means the ST system is very tightly coupled & the GLUE chip is probably the

I found an old block diagram of the ST, and all the major chips are directly connected to the glue, so would have to agree that it is pretty important.

>
> Are you sure it is not possible to find the registers in memory?
They would have to be only accessible in supervisor mode, so they must lie in the first few hundred bytes of memory - if they do exist.
It would be potentially disasterous to locate hardware registers in this address range, becuase when the computer is first switched on, the operating system reads/writes nonsense to much of the ram to determine it's size. Writing rubbish to the dma chip might do nasty things to any disks which were connected!!!

Some registers have 'multiple personalities', i.e. their contents changes depending on what some other register contains. This would be an awkward arrangement if the registers were held in ram. Maybe these register don't exist at all - maybe their contents is determined on-the-fly whenever a read request is made?

> I found some locations that were updated regularly near the video base

Yes, 32 locations is a bit small!

Wouldn't it be a bit slow, if everytime a peripheral chip needed to access
one of it's registers, a ram access was required?

> >> There are some hardware registers 'shadowed' in main memory though, mainly
> >> the Shifters configuration.
I think the shadow registers may have been a way of saving costs. By not
decoding the address range fully, it would be possible to use less chip
space.

Subject: Internet Explorer 4.0 problems
Author: Some Guy from HQ
Date: 10/2/97 10:59 AM

Please discourage users from installing Microsoft's Internet
Explorer
4.0 on their machines for the time being. We've discovered a bug
in
IE 4.0 that prevents the DOH Administrative applications from
running.
We've corrected a problem with the DOH intranet home page not
allowing
IE 4.0 users access but still have the applications problem. We've
contacted Microsoft and are working on a fix for that now and will
let
you know when it's corrected. If you have IE 4.0 installed on some
machines and need to reinstall IE 3.0 (and DON'T have a copy) for
users who need access to the Admin apps please let me know and
we'll
get a copy to you -- since it was released yesterday it appears to
no
longer be available on the Microsoft website. Thanks.

The TT as well as the Falcon needs no hostadapter, it comes with a full featured SCSI bus. So there is no limitation at all concerning the capacity of SCSI drives you can connect to TT and Falcon. Note, however, that AHDI doesn't support SCSI drives with a capacity of more than 1 GByte.

The lines appear then the mouse moves between two horizontal entries on the
menu bar, never when moving vertical.

The lines are temporary, in that they go away when the mouse is still. The
line appear to be approx 16 pixels long (in 640X400 mono) & are white on the
desktop background.Sometimes a few desktop pixels are changed, but these
revert to normal when the desktop is redrawn.

They are horizontal & are spaced 12 mm appart. The number of lines appears to
be related to memory activity, ie. clicking on a desktop icon produces a few
lines, highlighting an icon & then moving it around the screen causes more.

It definitly appears to be screen related, perhaps when the OS is moving
things around the screen.

>Are some memory positions corrupted? In that case I would suspect EMI
>or faulty soldering/ground.

When the memory is tested on its own, there appears to be no problems.

All I have done is to use 'Maddalt' to tell the system about the memory.

I don't know about any other variables, do you have specific information?

I am concerned the OS thinks the new memory is ST ram & is trying to access it
like memory below the 4 Mbyte limit. Is the vdi copy process different from

other memory operations?

>If you use MiNT the most easy solution would be to alter the mint kernel

The ST's Audio In pin is mixed internally with the monitor audio so that the sound will appear on the monitor speaker.

I have never tried this, but it should work ok.

You might need a strong signal (approx 1 volt I think).

It would be safe to try it with a walkman type cassette player running on batteries, put a resistor in series with the output lead. Try 1Kohm as a starter value. Reduce this if the volume is too low.

The quality may not be so good & it will be monophonic, so you may have to mix the left & right channels of your walkman together to get all of the music. You can make a simple resistor mixer to do this.

Anyone got one of these kicking around? Either 2 or 4 meg version would be acceptable. I already have a couple of STFM's, but when I recently borrowed a `mega', the smaller case size (and the fact my hard drive can sit on the top) and detachable keyboard really appealed!

Cheaper the better.....

john..

Sorry to butt in on your scart chat, but I have a related question.

Is it possible to link an atari st to a pc monitor (an old amstrad jobbie with a round 10 pin adaptor type arangement)? Do Maplin do this sort of stuff as well?

Phil Matthews

Actually the printer has gone back to the seller -- exchanged for a
Canon BJC-4100 -- which works with all of my progs so far (after
buying NVDI 4.11 - ouch!!)

Beware if you purchase a new Epson Stylus (insert series number)
because you will find that the ESC/P codes have been rewritten to run
with Win95 (MS rules okay)

So, go for 'older' technology - if it supports DOS then you will find
it also will run with Atari !!!

Should have no problems then - once you get the pinouts. I know that (especially in the first 2-3 years) ST Format used to cover this regularly in their letters pages; maybe someone with an easy to get to complete set could check this out (my copies are residing in the loft ATM).

Cheers,

Xav

Any one still out there?

I have been asked to look at an piece of history for someone who has an Atari 500 collecting dust, needs to do some assignments, and cannot afford to buy a computer.

This unit does basically work, but does not enough ram to run the word processor package that is with it. It is fitted with 512k. Looking inside, it appears I may be able to just fit the other four dram chips to make it into a 1meg machine.

Anyone know any reason why I cannot do this?

The plural of 'paradox' is 'paradise'.

I was comparing the ST's DMA chip to the offerings of NEC & Motorola; whose
chips have full address & data busses. Their only function is to move memory
around; you set the start address & length of data & they will do the rest
with no other support from the system.

The ST's DMA needs the GLUE & MMU working together to achieve the same result.

>> >> This makes it very different from other general purpose DMA controllers,

>disks which were connected!!!

You make a valid point.

I thought the ST just tested memory at certain boundaries, to determine what size of memory was connected. I am not sure if it does a full memory test, does it?

If the registers are not located near a boundary, then they will not be overwritten. Since a 256K ST was the smallest ever sold, putting registers in low memory might work, as they would always be available.

I looked some more at the MMU, & I found it does have an 8 bit databus.

Perhaps there are some registers in there after all, but it can only take in data a byte at a time. The MMU handles DRAM & screen refreshs, it must have a few registers for this since the CPU can be halted & refreshes continue.

>
>Wouldn't it be a bit slow, if everytime a peripheral chip needed to access
>one of it's registers, a ram access was required?

The ST's peripheral chips (like the 6850's) definitly have their registers internally. So does the MFP. The MMU & GLUE are hardly peripherals.

If the CPU wants to access memory, the GLUE decodes the address & selects the MMU, which then accesses the correct DRAM chips & puts the data on the bus.

If the CPU wants to acces a register, which may also be in RAM, the procedure can be the same.

AFAIK, the 68000 accesses RAM & I/O the same way, ie. there are no special signals which signify a bus operation is to a memory device or to an I/O port.

Again (AFAIK), the ST can access its memory without any wait states being inserted, so the cycle time depends on when DTACK is asserted.

The MMU has three inputs called DMA,DEV & RAM (all active low).

RAM seems to become active whenever the systems does a memory access.

DMA becomes active on disk operations.

DEV appears to become active when the OS wants to output a character.

The video base is still in ST ram, but the buffer the OS uses for drop down
menu's is in Alt ram.

I tried using the 'rdisc_tt.ttp' program; I hoped I could sieze all of the alt
ram before the OS took some away, but the ram disk program was not able to
find the Alt Ram.

Source record: 15536

I have lots of soft-running problems with my Mega st4.
Most of the softs I have just don't work!!! Most of the time the two bombs appear, specialy when I try to import things from the floppy-disk drive. I wonder if there is a way to check my computer, to find out if something is not working properly, etc..
Thank you to answer if you know something about it.

Do you use 2.06 or MagiC? Both handles "TT-ram" without problems, "lesser"
versions doesn't. With 2.06/MagiC and upwards it should (atleast in theory) be
sufficient to register the new memory with Maddalt().

Perhaps you need to set some system-variables as well, but I really doubt that.

3004. hard drive for ST

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-08 00:00:00 UTC
From: jack <jdarel@jeffnet.org>
Message-ID: <01bcd34c$83c91560$db58cbcc@jdarel.jeffnet.org>
Source record: 15539

I would like to put a hard drive on my ST. I have put out a request more than once in the past, and do not want another flood of responses extolling the virtues of SCSI hard drives, containing a mixture of facts and misinformation.

The situation is this: I have external hard drive cases, and have several hard drives in the 40-130 mb range. Most of these are MFM, and IDE, about 50/50. I have one SCSI hard drive. What I lack are interface adapters. I have received some reports that the MFM or IDE conversion is possible, others that it is not possible. If either conversion is possible, I would appreciate a schematic for making the conversion. I have searched extensively for an SCSI adapter to the ST cable, without success.

I am not concerned about hard drive speed....after all, the ST is an 8mhz machine.....I would be happy to interface one or more MFM hard drives, as I have so many of them, and using MFM would free up my IDEs for use on older PCs. However, I would be happy to find the SCSI adapter needed for the ST.

Thanks for any help I receive.

Speed is an even much more valid point against those registers in DRAM.

> I thought the ST just tested memory at certain boundaries, to determine what
> size of memory was connected. I am not sure if it does a full memory test,

You're right AFAIK, but it doesn't matter, as those registers are not in DRAM.

> Perhaps there are some registers in there after all, but it can only take in
> data a byte at a time. The MMU handles DRAM & screen refreshs, it must have a

As I said in another message, these are the DMA and video counters ! They
must be accessed bytewise, the reason being the thing you just discovered.

>>Wouldn't it be a bit slow, if everytime a peripheral chip needed to access
>>one of it's registers, a ram access was required?
>
> The ST's peripheral chips (like the 6850's) definitly have their registers
> internally. So does the MFP. The MMU & GLUE are hardly peripherals.

True, but they still contain lots of registers.

> If the CPU wants to access memory, the GLUE decodes the address & selects the
> MMU, which then accesses the correct DRAM chips & puts the data on the bus.

That's right.

> If the CPU wants to acces a register, which may also be in RAM, the procedure
> can be the same.

As they are not in DRAM, the procedure can be much faster. The GLUE can select
the corresponding register directly without going all the way through the MMU
to DRAM.

> AFAIK, the 68000 accesses RAM & I/O the same way, ie. there are no special
> signals which signify a bus operation is to a memory device or to an I/O port.

Yep.

> Again (AFAIK), the ST can access its memory without any wait states being
> inserted, so the cycle time depends on when DTACK is asserted.

Yep.

> The MMU has three inputs called DMA,DEV & RAM (all active low).
>
> RAM seems to become active whenever the systems does a memory access.

That seems to be right.

> DMA becomes active on disk operations.

I'm not exactly sure here. 'Disk operations' are certainly a far to general
term here. I believe the line becomes active if the CPU accesses the DMA counters.
Atari never released enough specification to clear this up completely.

> DEV appears to become active when the OS wants to output a character.

??? If 'disk operations' is a term to general, what is 'OS wants to output a
character' then ?? ;-)

Again : Atari never released enough specification to clear this up completely.

Cheers Peter

You will not find schematics for ST SCSI adapters on the net.

You may find them in German ST magazines (old issues).

If you are handy with electronics, some FPGA & CPLD manufactures offer
applications notes that give a good understanding of how to make a SCSI
interface. You would need to figure out the DMA interface yourself.

The only MFM adapters I am aware of are SCSI to MFM adapters, made by the
likes of Xebec. These are old & are while they do work, the results are poor
compared to a SCSI drive. The Xebec 1410 is one example, maybe you can find
one second hand. You still need a host adapter to convert the DMA to SCSI.

IDE drive interfaces are available, some are internal fittings, some connect
to the cartridge port. Try Systems Solutions in the UK.
>
>I am not concerned about hard drive speed....after all, the ST is an 8mhz
>machine.....I would be happy to interface one or more MFM hard drives, as I
>have so many of them, and using MFM would free up my IDEs for use on older
>PCs.

For several years, I used MFM drives on an ST. I was never able to get them to
auto boot & some disc utilities did not work.They are slower, given the old
MFM drives had poorer access times & there was the extra interface step.

> However, I would be happy to find the SCSI adapter needed for the ST.

These should be reasonably easy to buy.

I am using TOS 2.06 & I just have small program that uses Maddalt() to
register the new memory. When I look at the memory descriptor blocks
afterwards, I can see the new memory & the chunk the OS has grabbed for
itself.
>
>Perhaps you need to set some system-variables as well, but I really doubt that.

I think you are correct, I am not able to find any documentation about what
the variables are or might be.

TT owners may be able to help here, the TT's Ram can be both ST & TT.
The ST memory configuration is written to a location in memory, the value of
which is dependant on the memory found at startup.

How does the TT record the value for TT Ram?

I have looked at the file which gives the Atari registers for all of the
machines & there is no memory configuration for the TT in the file.

There is for the ST, but surely this cannot work for both machines.

How do the machines distinguish between ST & TT Ram?

Is it automatically given that any Alt Ram must be TT Ram by definition & the
OS ensures that DMA access cannot take place?

I now feel that I would be better off having 8 Mbyte of ST Ram, at least this
would mean the screen would be at 7F8000 & all the memory would be in one
block.

Doing this is not easy, however.

I think the person is being ST specific here, I know the 68000 can address
memory without an external controller.

I know it's easy to put static RAM onto the 68000, a little more complicated
for DRAM.

Yes, that's a good description.

The ST DMA controller is not a DMA controller.

>without console operating via an Ethernet).

Yes, the shifter is really just that, a data shifter. I used to think of it as
the video controller, but it's not really in that league at all.

It would be (relatively) easy to replace the shifter with a CPLD.

AFAIR, in later ST models, the MMU & Shifter are combined.

** stuff deleted about DMA registers being located in DRAM **

>
>These registers are definitely located inside the MMU.

Yes, I now agree with this, my original thought was based on the idea that the
MMU had no data bus interface, but I see that it does.

Do you know how they are addressed, the MMU has only 22 address lines & the
registers addresses are above this.

Is it a combination of the address bus & the DMA/DEV/RAM pins?

>

Not sure what you are trying to say here.

The video & CPU accesses are interleaved AIUI, but if video operations can only take place when the CPU is not accessing the DRAM, then yes, there is no way the video counter can be in DRAM as the operation has to be done without CPU intervention.

BTW, does the MMU use RAS before CAS, CAS only or hidden refresh?

From: David 'Septimus' De Ridder <david.de.ridder@bitsmart.com>
Message-ID: <343CBF1C.5B3@bitsmart.com>
Source record: 15556

I have MiNT v1.12b installed with the init/login tools. I also have a version (4.0a I believe) of Guy Gascoigne's Korn Shell for MiNT. I like the ksh and have gained some experience with it (under HP-UX).

My problem now is that when I log in with my default shell as this ksh, all processes started by seem to run in the background. It is really strange because while a process is running (top, ls, anything), the shell prompt reappears and is apparently the foreground process.

First I thought it was just an output problem, but my top keeps running and updating its info while all input from the keyboard goes to the shell prompt. The only way then to terminate the background process, is to kill it.

I do NOT have this problem with the init shell but I prefer the ksh.

Has anyone ever encountered this problem and/or solved it ?

It might be related to the fact that MiNT didn't get a proper fork() until
1.12.5 (or was it 6?). I haven't used previous versions (I use 1.12.6 now)
with MiNTOS so I'm not sure, but give 1.12.5/6 or 1.14 a try and see if it
improves.

3026. Help: TT SCSI Termination (Internal)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-09 00:00:00 UTC
From: lockwood@freenet.calgary.ab.ca
Message-ID: <61j4do$o3u@ds2.acs.ucalgary.ca>
Source record: 15561

I have a TT 030 with a revision I or J motherboard. Recently I added a CD rom drive to the SCSI port, and I'm having all sorts of problems (locking up during boot up with ExtenDos), and I guess that I need to remove the internal SCSI terminator that ends the chain between my computer and the internally mounted hard drive.

I've looked all over in there, and I can't see anything that looks like a terminator or indeed anything that is removable aside from the lithium battery.

Could someone please tell me just what I should be looking for, with a description of the piece and its location?

Thanks,

Funny you should say this, Frank.

First of all ... the terminators are 3 inline resistor packs which plug into sockets just behind the SCSI port. You should see the bank of them between the rearmost pins of the connectors which go to the floppy and hard drives. I should know as I was in there only a couple of hours ago!!

Anyway ...that's the easy bit! Your probs certainly sound as though they are to do with termination. Is the CD terminated?

Now to the funny bit .... I have not had this TT long and connected my SCSI bus containing HD,CD and streamer with no obvious problems.

Then ... I saw Uwe's note reminding people who had an external bus to remove the terminators. So ... I delved inside today and found the terminators were IN!!! I took them out!! On re-booting none of the devices on the SCSI bus were recognised during the scan (CBHD), the driver gave Sense Error 2100 and then did a 2 bomb crash!!

So .. I've stuck the terminators back again although I KNOW it makes no sense. I have just heard from Uwe who is as mystified as I am.

If anyone has a rational explanation I'd be overjoyed to hear it :-)

As far as your trouble goes, Frank, you should not necessarily believe that removing the terminators will cure anything. In fact your trouble may well be that the terminators are absent anyway!!

First off - concentrate on the termination of the CD. Is termination ON? Does the CD require TERMPWR or is it jumpered to provide its own?

Big mystery .... not a good day .... I'm left head-scratching.

Ah, the french....
Why did you leave your group in the followup if you wanted this to end?
Just curious.

Let me start off by saying that I SINCERELY appologise.

But the origin of this thread (before all those silly alt.stupidity
people got involved) was about techincal issues dealing with Intenet
Explorer's beta 4.0. I had also heard that the folks who owned Ataris
were having similar trouble, and could perhaps benefit from Ree Tard's
in-depth technical analysis.
It's funny, though, because I have a real hard time getting the "Yar's
Revenge" cartridge to work on my PC. Any pointers? That's what I love
about the internet. People helping people. People making faces at
people. People on top of people. People rubbing things on people.
People cutting off other people's heads (in a virtual way, of course).
The sharing. The caring. The endless fountain of liberating fluid
freedom that flows over the camphor tablets in our living rooms, our
bedrooms, into the drainage hole at the cores of our very beings. Yes,
we are constantly looking for that public urinal in cyberspace. Free
parking? Yes, as far as the eye can see. Further than the furthest
star on a road paved with the number of capilaries in 100 pounds, er,
sorry, kilograms of human flesh. But as close as your back yard. As
close as the very back of your head! That's the beauty of it. There's
never a dull moment, as long as we have bobzillions of electrons
shooting bitwaves hither and yon, over high tension wires at frequencies
that cause cancer and crackle when the humidity gets bad. That's not
just entertainment, that's reality! Matter of fact, all entertainment
is reality. Realer than anything I can make up on my own, that's for
sure! Connecting with others, exchanging ideas, being stimulated and
kindling the sparks of imagination that cook the burgers and give you
those blisters you show to all of your friends. And isn't that what
it's really all about? Isn't that where we're all going? Does this
kind of thing prevent war, famine, pestilence? Why, I sure think it
does. Could you ever pull the trigger on someone who sent you the email
address of a guy he knows that used to work for SeaGate and can direct
you to an ftp archive where you can get that driver for your 8-bit SCSI
adapter? Would you let the kid who sent you those midget porn files

waste away and die from malnutrition? Of course not!

But you say, "That's the big picture, but what does that mean to me?
ME, the Atari user in France? Where do I fit in?" You want me to break
it all down? Sum it up, as quickly and succinctly as possible? No more
pussy-footin' around, you want the straight shit on what I'm driving
at? In two words or less?

"Me Too"

And now you know the rest of the story.
Good day.

W'h'eezer

At this moment, I would only choose the Amiga as a viable alternative to my
beloved Atari's...I would never choose the Mac-I don't want to be just one
more Bill Gates puppet on a string... (jerk-jerk, watch Jobs jump!) :)

How does it work???

I unpacked the basic package (gs315.zoo I think), and every time
CAB passes it a .PDF file, GS gives me an error message, saying
it cannot locate some of its config files?!!

What is the black magical spell one must recite when installing it?
There was no ReadMe with this archive.....

-(10,000 pictures of beautiful hot sexy Celebrities CD-ROM - ME#3)-
Questions? CALL US IN USA 1-757-484-7538
(http://www.mephoto.com)

Check this out:

600+ pictures of Cindy Crawford
400+ pics of Pamela Anderson
250+ pics of Elle Macpherson
200+ pics of Christina Applegate
200+ pics of Alicia Silverstone -==< 10,000 CELEBRITIES!! >==-
200+ pics of Mariah Carey
200+ pics of Sandra Bullock
150+ pics of Liv Tyler, young star
130+ pics of Niki Taylor
130+ pics of Kate Moss!!! For a list of ALL files on the CD
100+ pics of Madchen Amick goto www.mephoto.com
100+ pics of Racquel Darrian - *WOW*
80+ pics of hot model Jenny McCarthy! (Nudity!)
80+ pics of Paulina Poriskova, sexy supermodel!
70+ pics of Bridget Hall, supermodel!
50+ pics of TRACI LORDS, yes! ***6 Celeb CDs in One!***
50+ pics of Daisy Fuentes, hot spanish VJ
50+ pics of Salma Hayek, sexy latina actress! ORDER NOW!
50+ pics of Teri Hatcher 1-757-484-7538
* 4000+ pics of other NUDE stars
* 4000+ pics of PG-13 rated celebrity poses
* 10,000+ pictures total, thats TEN thousand!
* Graphics viewing software for Windows3.1/DOS/Win95
* CD is BBS ready, with descriptions of files! And its Mac readable!
* Many more features and pictures of stars!
* NO AMATURE MODELS! - ONLY Celebs!
* If you have ME#1 and ME#2 - This CD is all the stars/celebrities from them

(For MORE information content at http://www.mephoto.com)
or call 757-484-7538 in USA to order via phone!

Other information:
* Packed in white shipper: No signs of nudity (Wife protection plan!)
* There are over 10,000, that's TEN THOUSAND FILES, on ME#3 alone!
* All pictures are high quality at least 640x480!
* Directories are arranged in NUDE/NON NUDE format for easy use!
* Graphics viewing software for Windows/DOS/Win95
* CD Is ISO-9660 Macintosh compatible if you have a Mac JPG viewer
* It's truly BBS-ready with detailed descriptions of all files!

* ME#3 will save you -ALOT- of download/searching TIME & MONEY!
* Sysops! Has a files.bbs conversion program for different formats!
* Many more features.. Guaranteed or your money back!

This CD represents high quality work. Here is the pricing:
$$$ $36 each (plus $2 shipping, $5 shipping outside USA) $$$

(*) For FAST results, visit http://www.mephoto.com
And fill out a order there. We take all methods of payment.

(*) AOL USERS: You must use AOL 3.0 Web Browser or HIGHER to order at our
automated web site, otherwise request an order form via email.

(*) Or call 757-686-1271 to order via credit card over the phone!

(*) If you can not access the World Wide Web and would like an ORDER FORM
sent to you by email, reply to this message at cds@mid-night.com
If you have any further questions feel free to email us!

(*) Wholesale/Dealer/Bulk information/prices available upon request.

Help me please!

I just got a new to me megafile 30. It powers up, the activity light stays lit (doesn't flash) I can't hear the drive spinning.

The computer thinks the logical unit isn't there.

It is set to drive 0

Any ideas? Is the whole thing toast?

Willard VanderPloeg

3040. MiNT/minixFS installation problem

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-10 00:00:00 UTC
From: David 'Septimus' De Ridder <david.de.ridder@bitsmart.com>
Message-ID: <343E3497.362B@bitsmart.com>
Source record: 15575

I have been running MiNT 1.12 with init tools for about six months, but now I want to install MiNTnet (for the httpd). So I decided to install the MINIX FS because that would be more convenient (access rights, long filenames etc.). I have a SyQuest 555 removable harddisk (44 Mbyte) available for minixFS. This disk is currently a 1 partition TOS FS, which is drive E: .

Therefore I downloaded disk1 from the MiNT Distribution Kit which contains a Setup program to do the basic installation for me. I have configured it right (I think) and when I run the installation procedure, it installs MiNT 0.95 and the MINIX XFS driver. MiNT executes, the XFS driver is loaded but then MiNT complains it can't find 'init.prg' and then exits ("Leaving MiNT") although the documentation specifies you only need init for the multi-user config. After a lot of trial and error, it still doesn't work. I even tried to drop my init in several places on my harddisk. My E: is still a TOS FS partition and although the Setup prgram has moved many files back and forth, my system is still the same.

Is there any way to do installation manually, if possible with preservation of MiNT 1.12b ?
I currently have a MINIX.XFS which is version 0.55. I also have many un*x tools available (ls, chmod etc.)

I just need to configure E: as a Minix partition and be able to access it under MiNT as such.
Please help !

This is all in the Quick FAQ (check ou my .sig)

For MFM, the only thing I can suggest is to get your hands on an Atari
Megafile 30. These beasts contain an ACSI>MFM adapter, and an MFM drive,
so you might be able to replace the 30Mb mechanism by a larger one.

As for IDE, there are internal adaptor boards, but have drawbacks (ie:
fitting a 3.5 drive internally requires adapting a new PS, and a new
case or serious cutting). It is possible, but you need to get your hands
on one of these boards. One is made in Germany (by Woller+Link I think),
the other is made by The Upgrade Shop in the UK (who sadly don't appear
to be very supportive).

SCSI is the recommended standard nowadays. You need The Link 2 or Link97
which are both SCSI host adapters.

There are no DIY instructions to do any of these anywhere, all are
commercial products that include specific PALs.

: Is there any way to do installation manually, if possible with
: preservation of MiNT 1.12b ?
: I currently have a MINIX.XFS which is version 0.55. I also have many
: un*x tools available (ls, chmod etc.)

: I just need to configure E: as a Minix partition and be able to access
: it under MiNT as such.

Rule #1. Don't use the Mint Distribution Kit. It's horribly out of date,
and the impression I have is that the install routines are somewhat
suspect. You're better off to use KGMD or KEMD, or, if you have a working
MiNT setup, just get the MinixFS package (available from any good ftp site).

The docs included with the MinixFS package should be enough to get you
started; I seem to recall, though, that I needed to have MiNT running
with MINIX.XFS in order to run minit.ttp, something that isn't mentioned
in the docs, although it does make sense. Note that minit.ttp will erase
everything on the partition you're installing the filesystem on -- not
surprising, since the layout of the filesystem is entirely different.

If you're running the ICD driver, you may run into problems depending on
the version. AHDI and HDDriver both work perfectly.

I believe so, but I guess few people can really tell it, AFAIK Atari never released
such details on the interactions between the custom chips.

I think the /DEV is a decoded selection signal for the I/O space (registers in the
$FFxxxx) area, and the 22 address lines are ample means to decode the remaining four
hex digits.

What you're talking here is the DRAM bus cycle to fetch a word to be passed to
the shifter for displaying it at the screen. That is interleaved with CPU bus
cycles that's right. But if the actual video pointer register were in the DRAM,

there would be a DRAM cycle for reading the pointer, another cycle for reading the video data word, and a third cycle to writing back the incremented pointer register; all of which had to be interleaved with CPU access.

> only take place when the CPU is not accessing the DRAM, then yes, there is no

> BTW, does the MMU use RAS before CAS, CAS only or hidden refresh?

I don't really know, I never investigated that. I used to think of RAS before CAS being the easiest to implement, but this is pure guesswork, as the others might have fit into the general MMU working scheme just as well.

Is there even any hardware available to hook up an older Atari 520 ST to a PC lan? I know this is quite a stretch, but I'm just shooting for some way to make the machine live a bit longer.

I also remember something about homebrew MFM hard drive controllers for the Atari 520 ST and adding dram piggybacked to bring the total ram to 1024k ram. Does anyone have any information about these hacks?

Check that the TT internal HD has terminating resistors connected
and termpower.

My current configuration.

ATARI TT EXTERNAL CASE
50 pin 50 pin 25pin 50pin 50pin 50pin 50pin 50pin
|-----------|=======o++++++++++++oo-----|------|------|------|
| ^ | | | |
HD0 CD5 TS6 HD1 HD2

where :-

---------- = 50 way ribbon cable (internal)
========== = TT motherboard
++++++++++++ = 25 way cable
| = 50 pin header
o = 25 way D connector
oo = 50 way centronics
^ = terminating resistor packs

Configured so that terminating resistors are in HD0 and HD2, all
other terminating resistors removed or disabled, including the TT's.
termpower on HD2 and HD0.

This is working very well under both TOS and LINUX.

> If anyone has a rational explanation I'd be overjoyed to hear it :-)
>
I have just spent some time on this as I reinstalled LINUX and was
having problems (gtar complaining about corrupt headers).
I ended up removing the TT ram card and the problem disappeared!!!
Currently running with 4MB ST ram only.

regards

In excellent working condition. Check carefully for the items. They are good and the best on their category! This system works fine and you will be able to produce your music in the digital domain. Whether sequencing or audio editing, it performs fine.

1. Falcon 030 with 16 MB RAM. All required Steinberg audio & timing fixes have been done. Line level audio in.
2. 2.5' 60MB IDE Hard disk
3. Wizztronics DEKA interface for using external keyboard
4. Honeywell keyboard
5. Beetle mouse
6. SCREEN BLASTER II (for higher screen resolution)
7. Wizztronic Cart Master LIte (allows plugging in two cartridges at once) (for Cubase and Zero-X)
8. Monitor adapters for VGA and Atari Monitors.
9. Steinberg FDI (DSP PORT Digital interface for digital recording: DAT; CD, etc.!!)
10. External 1GB SCSI (no thermocalibration) Seagate hard disk.

SOFTWARE:
(all are original disks & include manuals)
STEINBERG'S:

1. Cubase Audio V2.06
2. Studio Module
3. Cue Trax
4. Style Trax
5. Data DAt (for backing up files to DAT)

---

6. Zero-X (Superb sample editing program)
7. BAnd-In-The-Box
8. ExtenDOS PRO 2.4a (CD-ROM driver with direct CD record to hard drive)
9. HD Driver 6.0 (Best Hard Disc manager for Cubase Audio)
10. ICD SCSI PRO Utilities 6.55 (covers things not handled by HD Driver)
11. XBOOT (Wonderful program launcher)
12. Diamond Edge II
13. Diamond Back III
14. Steno
15. Stalker
16. Image copy 4.0
17. CD-ROMS & MORE software.

Price: $ 1150 OBO./ No hard disk $1000 I will sell isolated items if the Falcon is bought first. Just send mail and offers so I can consider you for when it happens. fpinto@byu.edu

3055. OberonV4 beta for Atari-ST available

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-11 00:00:00 UTC
From: eglis@ubaclu.unibas.ch
Message-ID: <1997Oct11.101013.47629@yogi.urz.unibas.ch>
Source record: 15590

A new release of ETH Oberon System V4 for Atari ST & TT computers is
now available. Oberon is a programming language together with a complete
operating system, developped at ETH Zuerich by Nicklaus Wirth, the inventor of
pascal and modula-2. For more info about Oberon have a look at
http://www.math.tau.ac.il/~guy/Oberon/

The release can be downloaded at ftp.inf.ethz.ch in the folder
pub/Oberon/OberonV4/AtariST

The system is supplied with an Oberon(-1) compiler, a linker and
comes with complete source code. Please remeber that the Compiler does not
support all Oberon-2 features, to wich some of the documentation is referring
to.

ST-Oberon has been tested on TOS 1.0 and 1.4 on a 1040STF, a MEGA ST2
and a Stacy. It may be that the current version of Oberon won't run
on the newer TOS versions, since it uses some system variables, and
modifies the exeption vectors.

Hardware Requirements:

Atari ST or TT computer with at least

2 MB RAM (for serious use, altough ST-Oberon will also run with
only 1 MB)

4 MB of harddisk space, preferably on a harddisk connected to the
ACSI port.

have fun!

please send bug reports or feedback to eglis@ubaclu.unibas.ch
under the subject "stoberon".

3056. Re: TT RAM burst/non-burst mode

> of what the difference is.

The "burst mode" is a feature of the 68030 CPU.

When burst mode is enabled, the CPU fills its internal caches in
cache-line sized chunks [16 bytes] rather than smaller four-byte crumbs.

(Burst mode works best with caches enabled)

With well written software [that maximises "locality of reference" WRT
data], burst-mode is somewhat faster than non-burst mode, as the CPU
spends less time in "give me this piece of data" conversations with the
RAM controller hardware, and can therefore spend more time computing
instead of waiting for the RAM hardware to respond with "here is the data
you requested".

(BTW: The above was the viewpoint of a programmer, not a hardware
designer/hacker, so my comments shouldn't be taken as gospel on this
subject)

--

Any email sent to my inca address will bounce, however I can now be

: (640x400): but you need a special cable which synthesises a combined
: sync signal out of the separate horiz. and vertical ones the ST supplies.
: Mono would be fine, right?

I never had any problems using VGA displays in "ST High" resolution
(640x400) on an Atari ST machine. All you need to do is correctly connect
a suitable plug onto the monitor.

Actually, I do have one VGA monitor that would not work in this way. So
perhaps it does vary.

The fact is you can use a VGA display on the ST, and it's as easy as
connecting the appropriate plug.

I believe someone else already posted a location where the plug pinout can
be found, otherwise it's quite straight-forward to work out if you have
the pinout for the ST monitor connection and the VGA connection.

From: Martin.Byttebier@ping.be
Message-ID: <876680274_OASIS_@ping.be>
Source record: 15398

In article <343E3497.362B@bitsmart.com>
David 'Septimus' De Ridder <david.de.ridder@bitsmart.com> said:-

>I have been running MiNT 1.12 with init tools for about six months, but
>now I want to install MiNTnet (for the httpd). So I decided to install
>the MINIX FS because that would be more convenient (access rights, long
>filenames etc.). I have a SyQuest 555 removable harddisk (44 Mbyte)
>available for minixFS. This disk is currently a 1 partition TOS FS,
>which is drive E: .

Hoi,

First of all make sure the mint.cnf file is right.
It should be something like this. (Part of my mint.cnf)

```
***************START FILE***************
CON=u:\dev\console
PRN=u:\dev\centr
cd u:\
setenv UNIXMODE /brUs
setenv TEMP /tmp
setenv PATH .,\bin,\usr\bin,\usr\local\bin,\usr\etc,\usr\ucb
# ------------------------------------------------------------------------
# NOTE NOTE NOTE NOTE
# In the following change the n: to the drive of your minix partition
# and uncomment once partition has been created
# ------------------------------------------------------------------------

sln n:\usr\bin u:\bin
sln n:\etc u:\etc
sln n:\usr u:\usr
sln n:\home u:\home
sln n:\tmp u:\tmp
sln n:\var u:\var
# ------------------------------------------------------------------------
echo Now booting MiNT.

****************END FILE****************
```

If you're running MiNT you can install a minixfs partition as followed

Copy MINIXFS.XFS to your MINT folder, reboot (under MiNT).
Execute MINIT.TTP and enter the following parameters without the
quotes ofcourse

"-V -n -P E:"

"-V" installs a V2 file system for longer names
"-n 2" tells Minix to allow up to 30 character filenames
"-P" adds protection to stop TOS trashing your partition.
"E:" the partition which will be changed into a Minixfs
partition.

Please before you try something make a backup of your system. You
never know. If something went wrong don't blame me. I've warned you

Hope this will help.
CU

3066. Atari Notator Program-Help please

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-13 00:00:00 UTC
From: stenan@aol.com
Message-ID: <19971013044000.AAA18973@ladder02.news.aol.com>
Source record: 15401

Hi, I own a recording studio and I use an atari computer with the Notator program to
sync my tape machine with sequences. I'm having problems booting up the computer and loading the program. sometimes it works, and sometimes it doesn't. The computer tends to crash alot as well, I have lost hours of programming when it crashed.

Is there anything that anybody knows about atari computers to help me fix my problem?
I love the program and want to continue to use my Atari.
I wish it were more reliable!

E-mail me if you can help

There is a software package called TUWTCPxx (not sure what xx is now, but a search for TUWTCP should turn it up) which has hardware details for connecting a PC parallel port adapter to an ST. Expensive option, the adapters are expensive & hard to get.

There is also supposed to be an ASCI port ethernet adapter in design sowewhere.
>
> I also remember something about homebrew MFM hard drive controllers
>for the Atari 520 ST and adding dram piggybacked to bring the total
>ram to 1024k ram. Does anyone have any information about these hacks?

MFM drives are old & very hard to get nowadays, unless you live near junk shops. Better performance can be got by buying an ASCI to SCSI host adapter & a SCSI drive. You would have had to get the host adapter for the MFM drive anyway, since the MFM drive also needs a SCSI to MFM adapter.

Memory hacks are available on umich archive, why settle for 1 meg when 4 is just as easy & will give you better performance.

Nicolas Bales has a FAQ, but I can't remember the URL.
Search for posts by N.Bales, the URL is in his sig.

Or, he might post here, so keep reading.

David,

the program which actually minixifies a partition is called minit. You need
to issue a command along the lines of
minit -V -n 4 e:
but don't just type that straight in, see if you can't find some documentation
of minit first -- it should be included with minixfs.

3069. Help - My Falcon's SCSI is dead!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-13 00:00:00 UTC
From: jhanner@ford.com
Message-ID: <3441cf60.1605238@news.ford.com>
Source record: 15404

I've just spent a very frustrating (and fruitless) Sunday checking my Falcon's (C-Lab MkII) motherboard for dry solder joints around the SCSI chip and connectors.

I had an intermittent problem where occasionally the Falcon wouldn't boot the HD when powered-on, but usually just moving the case or tapping it and rebooting would be enough to get it going.

Now - nothing! If I try to run ICDBOOT, AHDI, or the demo version of HDDRIVER I get messages like "no logical drive found" or "unit 0 not responding".

The HD (internal SCSI Quantum Daytona 540Mb) will happily start running when I power-up, but it doesn't whir into action after the memory test like it used to. Sob :-(

I also have an external Zip drive attached, that isn't detected either.

Has anybody ever seen this sort of thing before? I have a feeling that the SCSI chip could be fried, but I don't know how to determine where the fault is. According to DOITF030, fuse 1 protects the SCSI-bus, but the fuse 1 on my motherboard looks more like a capacitor than a fuse - certainly not the same as fuse 2, which looks like a glass diode.

Any help you can give me will be greatly appreciated - even if it's just the name of the nearest Atari-repairer in Essex/East London!

Jim

I'm not sure exactly how you plan to connect the machines, but maybe you could try some sort of Ghostlink type connection that mounts PC drives to the ST desktop via a serial link. I'm not sure if it works with network drives that are already mounted on the PC. Ghostlink can be found on Hensa I think. There are other programs in my Quick FAQ, but I'm not sure how they mount the connections on the ST side.

Jim:

Is your SCSI bus properly terminated (at, and only at, both physical ends
of the scsi cable)?
Ensure you don't have long stubs coming off of your scsi cable.
Have you tried booting with only one of your scsi devices connected to the
scsi bus?

I'd be inclined to suspect a scsi configuration problem before a fried chip.

I've been having intermittent scsi problems on my Falcon ever since I
attached an external case with a disk. I suspect cable impedance mismatch,
but I never got around to fixing it.

Good luck,
Art

^^^^^^^^^^^^^^^^^^^^

Jop, C-LAB had done some modifictions with the SCSI Bus!
(I don't know what all in the hell..)

No one SCSI-BUS at the world will work nice as a 'Y'
You know what i mean?

'Y` means: Poin1 Falcon(ID7) (mostly) Point2 internal SCSI / Terminated
Point 3 externa ZIP / Terminated.

What's the last connection to that SCSI-Bus, your external SCSI-ZIP ?

Any SCSI Bus would'd work well in Y Form.

All SCSI Devives have to build ONE Line.

Falcon (ID7) ex. Device (ID0) ex. Device (ID1) Zip(ID2) + Terminator ON!
#############---#################---#################--########

Any other form of that fucking falcon SCSI can't work.

>I also have an external Zip drive attached, that isn't detected
>either.

Remove it, your internal SCSI will work well.

Think before connect! ;-)

In this moment your falcon is in the middle of the bus..
On both ends of your bus you will have terminator packs on..

Whats going on with resistors in a paraell circuit?
You get only a 'half' of around 330 Ohm..
Signal current in any signal line grows up to double level..

Effect:

Your SCSI Controller (5380J2) goes overload..
(It's a PLCC Chip nearly the external SCSI2 Connector) (Mostly in a socket)
(A very good chance to blow the signal lines)

>Any help you can give me will be greatly appreciated - even if it's
>just the name of the nearest Atari-repairer in Essex/East London!

Remove the external Device, try again!
If you don't have access to your internal scsi device.
Take that single scsi controller chip, remove the old one..
(Ask BEST for a new controller, if it's defective)

Take only exactly the same type of scsi controller!!!
Some others, like from a TT, can't work on a falcon mainboard!

I think that the fuse is not blown. (TermPwr)
(Smal fuses in that design are called 'microfuses')
(Replacement only by desolder) ;(

Good Look

Regards, Robert

I also use Notator. The only problem I have encountered is when the
'dongle' contacts
get dirty. Have you cleaned them? A cotton swab and some isopropyl
alcohol is good.
Contact cleaner is better.

3079. Programming Spec on PAM/s adaptor

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-14 00:00:00 UTC
From: SimonJ@nospam.datafit.co.uk
Message-ID: <344328f1.0@hermes>
Source record: 15414

Several years ago, I bought an ethernet interface for my TT; it is an ACSI device and came from a
German company called PAM. The box itself contains a 68008 processor and an ethernet controller. The
box itself says 'PAM/s adapator' and not a lot else.

Has anyone got or knows where I can get them from, the programming specifications for this beast?

Thanks in advance,

Simon J

Yes - I think we've had this sort of conversation before. I understand
tha SCSI needs in-line devices with termination at either end, like
your diagram (below).

>All SCSI Devives have to build ONE Line.
>
>Falcon (ID7) ex. Device (ID0) ex. Device (ID1) Zip(ID2) + Terminator ON!
>###############---###################---###################--#########

<snipped a bit>

>In this moment your falcon is in the middle of the bus..
>On both ends of your bus you will have terminator packs on..

The C-Lab modifications removed the Atari terminator packs, and
replaced them with a ribbon cable to the internal HD. There are no
additional resistors anywhere near the SCSI port/chip/cable. I can't
understand where the termination comes from, unless the drive has
inbuilt termination, in which case - how do I remove it?

>Whats going on with resistors in a paraell circuit?
>You get only a 'half' of around 330 Ohm..
>Signal current in any signal line grows up to double level..
>
>Effect:
>
>Your SCSI Controller (5380J2) goes overload..
>(It's a PLCC Chip nearly the external SCSI2 Connector) (Mostly in a socket)
>(A very good chance to blow the signal lines)

Oh dear :-(I was afraid that somebody might say that. My SCSI chip
is soldered directly to the motherboard, so I hope I can get a
replacement chip with a socket. I only got the Zip drive working last
week and I wonder if this is the reason the chip blew. The internal
device has worked great for over two years, but your explanation of
the signal doubling sounds correct.

>Remove the external Device, try again!

Tried it, but it didn't work.

>If you don't have access to your internal scsi device.
>Take that single scsi controller chip, remove the old one..

>(Ask BEST for a new controller, if it's defective)
>
>Take only exactly the same type of scsi controller!!!

Sorry, my automated fingers deleted the relevant post before I replied to it (doh!).

Would the person who wanted an English copy of Outside (Steve something?) mail me; I've got a copy I bought from 16/32 when they still dealt with it which I'm willing to sell (I've since got more real memory for my Falcon).

Cheers,

Xav

>inbuilt termination, in which case - how do I remove it?

That's correct, but my description brings a confusion.

You have your contoller in the middle, on both short ends you
found terminator packs, that can't work well.

Remove the external SCSI Drive.
Use your Bus in this form:

Falcon internal SCSI new wire external Zip
#######--###############----------############+Term

Flat->50pin-50pin->DB25 ZIP
(Adaptor from 50 pin flat to DB25)

Your bus works well, but the falcon is not terminated!
(The one and only chance if i can see)

(Otherways, insert three terminator packs, remove internal flat wire and
use ALL your SCSI Devices from the external SCSI2 connector.)
(A bad job..)

What C-LAB is doing works for one internal device, but not more.
Ask C-Lab for more SCSI devices!

>is soldered directly to the motherboard, so I hope I can get a
>replacement chip with a socket. I only got the Zip drive working last
>week and I wonder if this is the reason the chip blew. The internal
>device has worked great for over two years, but your explanation of
>the signal doubling sounds correct.

A realy bad job..
Ask sombody in your near, you must found sombody how was can desolder plcc.
Clean up all solder pads (after desolder the bad chip)
Insert a socked, watch for short circuits between the pads! before!
solder the socket to the main pcb. >Insert a new chip.
Do not overheat the main pcb or parts around the controller place.

The only chance to test after fitting is to connect a device.
(Use a old one, save your data before you write new data !!)

That's all, i hope so..

>Thanks for your very helpful advice. I'll replace the chip and see if
>it works.....

Do not make your first solder steps with that chip! (Tip!) ;-)
Ask sombody with a 'license to solder' (not to kill) :-))

Don't connect your devices again in the 'Y' form. ;-)

BTW: The best form of falcon scsi is the original ..

Regards, Robert

3089. Can someone help me fix my dead 1040STfm?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-15 00:00:00 UTC
From: Scott McLauchlan <scott@isd.canberra.edu.au>
Message-ID: <3444188F.F7866259@isd.canberra.edu.au>
Source record: 15424

I recently bought an Atari 1040STfm and a SM124 monitor at a junk sale for $10 "as is". Unfortunately the ST is faulty, and I can't test the monitor without the ST.

The ST powers up, and I get a display from the RF modulator, but that's about it. Sometimes the display is a blank white screen, sometimes a black screen with a white border (occasionally with white/multicoloured junk in the bottom 5% of the black area), sometimes a white screen with a row of 20 little black bomb icons in the middle (often on little "poles"), and sometimes a white screen with 4 little black bomb icons and a few thin, multicoloured horizontal lines.

I've opened up the case and made sure all the socketed ICs are seated properly. However, there's something that worries me. There is a vertical row of six sockets in the lower left corner of the board which I'm sure are for the ROM (U63 (also marked H-0), U59 (H-1), U48 (H-2), U67 (LO-0), U62 (LO-1) and U53 (LO-2)). However, only two of the sockets (U63 (H-0) and U67 (LO-0)) are populated. The others are empty. The chip in U63 (H-0) has the following markings:

C101631-001 RP231024E
(C)ATARI 1987 0562
38 8737 Z00

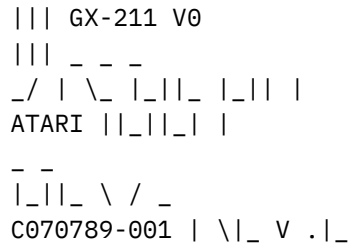
The chip in U67 (LO-0) is marked:

C101632-001 RP231024E
(C)ATARI 1987 0561
38 8737 Z01

I thought the ST had 192K of ROM, held in six 32K x 8 bit PROMs. Now, the "RP231024E" marking made me think that the chips could be 64K x 16 bit PROMs, making a total of 256K of ROM. However, 231024 PROMS are 40 pin devices, and the chips in the ST are only 28 pin. On the other hand, the chips could, in theory, be 128K x 8 bit ROMs, making a total of 256K of ROM. They would, at an absolute minimum, need 17 address pins, 8 data pins, Vcc, Gnd and CE, making a total of 28 pins. Also, there are two pairs of pads near the ROM sockets, each with one marked "256K" and one marked "1M". The "1M" pads are bridged on both pairs. Now, a 32K x 8 bit ROM would be 256 Kilobits, and a 128K x 8 bit ROM would be 1 Megabit.

So, does anyone know what's going on. Has someone taken out four of the ROM chips, or should there only be the two? If there should only be two, does anyone know what else could cause the problem I'm having?

The board has the following markings on the middle of the bottom edge:



Finally, does anyone know where I could find a circuit diagram for the machine? It would be a lot easier to troubleshoot with one.

Thanks in advance.

I can't confirm the chip identities, Scott, but it sounds as though
you have an ST with the "well known" mod. to take 2 chip ROMs.

Early TOS was on either 6 chips or 2 chips. From v1.6 TOS was on 2
chips.

I would guess the previous owner had v1.0 and could only find v1.4 on
2 chips so has done the mod. Until the thing fires up, of course, you
won't find out what's there.

The symptoms you describe are definitely "bad-connection" type. You
have pressed the socketed chips home so you will now need to look for
faulty soldering. This is prob. around the ROM area where the m/c has
been disturbed.

Sounds very like a memory problem, could be the MMU chip or a problem with a
faulty DRAM.

TOS was shipped in 6 chip & 2 chip versions.

The 6 chip TOS 1.2 version was 192K in size (6x32K)
The 2 chip TOS 1.04 version was 192K in size
The 2 chip TOS 2.06 is 256K in size.

They would, at an absolute minimum, need 17 address pins, 8 data
>pins, Vcc, Gnd and CE, making a total of 28 pins.

Correct

Also, there are two

I believe you have the correct number of chips & the solder bridge is set
correctly.

>
>So, does anyone know what's going on. Has someone taken out four of the

I does sound like a memory problem.

>Finally, does anyone know where I could find a circuit diagram for the
>machine? It would be a lot easier to troubleshoot with one.

AFAIK, there are no schematics available on the net, you have to buy a service manual. However, people here will help quite a bit.

You could always start with the official repair method of lifting up one end of the ST & letting it fall (put it on a hard surface first). This is not a joke, it's supposed to re-seat chips.

I had the same problems as you when I put a memory expansion board into my 520 STFM. The board had three broken connections ,actually bad printed thru holes on the board that connected to the Shifter chip.

I had disconnected the on board memory & when I powered up the ST, all I got was a black screen on the TV. I traced the signals from the Shifter to the expansion board & found the broken connections.

Before I got them all fixed, I saw pretty much the same type of stuff you are now seeing on your screen, ie. bombs (sometimes all across the screen) & vertical lines on the lower half of the screen.

You will need to trace the problem which could be a broken track, a loose MMU chip or a faulty memory chip (I am assuming your memory is all on board).

I will have a look at my STFM when I get home & get some chip numbers.

Somebody else may also have fixed this problem & may post also.

That was a wonderful piece of hardware with beautiful software, Atari LAN,
TCP/IP and Novell clients.... you should find out the original software to
make out the best of it, maybe the original package contained programming
information of the adapter, only PAM could help you about this....

or white screen with lots random dots.

It may be your a RAM chip is bad, you can try powering up a while. Then power
off and very quickly remove the power regulators in the ST. The RAM should be
below the power regulator. Feel if they are exceptionally hot. If they are
then you have a bad RAM chip.

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitor, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's

Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Web Site with Michael Currents List of

Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Skip,

I believe the AlberTT is simply a VME ISAC. Which means that you get one resolution, period. The card can change resolution only by changing the board configuration. There are PALs you can get for either 1024X768 or 800X600, both 16 color. Yours probably has 1024X768.

First of all, I would like to thank everyone in this newsgroup who
helped me out doing the Minix installation.
It works fine now with Minix 0.60 pl 10. Indeed, the MiNT Distribution
Kit proved rather useless and this leads to my new problem :

Most of my binaries (ls, tar, etc.) are obsolete and do not work
properly on my Minix partition. Does any know where (on the Net) I can
obtain recent/up-to-date binaries for my Minix partition ?
My main goal is 'just' to get MiNTNet running, together with an httpd.

BTW, is there some sort of MiNT FAQ (up-to-date please) somewhere
available ?

Thanks anyway,

David

Hi Deryl,

The PS3000 is a little difficult to find and is worth about $75-$100
alone depending on the individual, your 1040STe isn't worth very much,
maybe $75-$100, the HD and floppy aren't worth much as all, maybe $25
for both, but you"ve got at least $200-$250US worth of equipment, $150
canadian I believe is less then $150US, I don't remember the currency
exchange, have the guy pay you with a US money order, this way
you get US funds.

Curt

3102. Re: TT RAM burst/non-burst mode

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-16 00:00:00 UTC
From: hyc@frisky.la.platsol.com
Message-ID: <626fbk$umd@frisky.la.platsol.com>
Source record: 15437

In article <6115nu$ra6@lotho.delphi.com>,
Joe Mirando <jmirando@streport.com> wrote:
>Can anyone enlighten me as to the purpose of TT 'burst mode' RAM?
>I'm in the process of increasing TT RAM from 4 to 16 meg and saw the
>burst/no burst addressing jumper on the RAM board, but have no idea
>of what the difference is.

Burst mode requires special SIMMs to operate. They used to be called nybble-mode DRAMs, but (practically) no one in the memory industry today sells them or has even heard of them. I'm told that EDO memory now common on PCs uses the same concept, but I don't know if they are directly compatible.

The fully gory discussion requires an explanation of CPU memory accesses, bus timing, and other such info, but can be distilled into this much:

Ordinarily, when a CPU wanted to get something from memory, it would first have to assert an address for some number of bus cycles, and then the word of data would become available some number of cycles later. For every word being accessed, an address had to be asserted first. In burst mode, the CPU asserts an address and a special "burst" signal, and the memory system returns the word at the requested address first, and then on the following three bus cycles it returns the following three words, in rapid succession. This saves the setup time that normally goes with asserting the address, etc.

On a 68000, a byte or word memory access always required 4 cycles. On 68020 this could usually be cut down to 3 cycles, and longwords could also be accessed in this amount of time. On 68030 in burst mode, you can get the first longword in 4 cycles, and then 3 more longwords in 3 more cycles, so instead of 12-16 cycles, you're only using 7. There are several restrictions, of course - you must start from a 4-word aligned address (i.e., memory addresses that are integral multiples of 4), you must be doing 32-bit (longword) accesses, and the memory system must support synchronous bus cycles. Also the 68030 only performs burst accesses on read operations, specifically for filling its instruction cache. On 68040, a MOVE16 instruction was added that allowed reads & writes of 16 byte chunks of data (as opposed to just instructions) in burst mode.

Btw, in case it wasn't obvious before, the memory is called "nybble-mode" because each chip returns 4 bits of data on a burst request, instead of just 1 bit. And on 8 or 9 chip SIMMs, there are 8 chips because each chip stores a single bit of a particular data byte. (The 9th chip stores parity bits when it's being used.)

As you can see, the 68030 burst implementation has very limited impact on overall system performance. For code that does not loop, or that does not

fit inside the instruction cache, instruction fetches can occur almost 180% faster than otherwise. Data fetches aren't improved though, and code that is already in the instruction cache is already running as fast as possible.

From: marcelv@stack.nl
Message-ID: <6259q2$27g@snail.stack.nl>
Source record: 15438

Hello,

Pherhaps this is the chance yo've been waiting for. A genuine Falcon for sale. It has 16mB! ram, with 84 mB harddisk. And of course all the software you need. For instance C/C++,pascal,cubase 1/2/3/audio,dsp assemblers and lots of fun games. And diverse mint versions and related software.
The monitor that comes with it is lame, but you'll get it for free.
As well as some midi cables.
The price is 650,- guilders. This might be a bit expensive but it's a lot of atari.

If you are interested mail me.

>>misinformation.

Ok..... Buy a DEAD or dying external hard drive for the atari... even a
20M one... It will have a board in it that converts from atari-whatever to
regular SCSI... Most likely it is the physical DRIVE that is dead, the
board will be fine... Hook ANY scsi drive to it (68pin differential
whatevers not included in this offer, void where, etc, your mileage
may...) Oh yeah, you can chain a FEW scsi drives (or faked ---see below)
to this setup: endless 16M partitions.... Wheeeeee!

You will need the formatting software to go with it (the orig 20M
thing)....

You want to use MFM or RLL ?? Maybe that near dead box used an MFM or RLL
drive... then it already has an OMTI or ADAPTEC bridgeboard in it...
Wants the same power your drive does, and the mystery atari converter card
does too...

Connect mfm/ rll drive, you original dead box's formatting software will
want the drive geometry, go find HDREF or similar for headsxcyls...
sectors: 17 mfm 25 for adaptec rll 26 if you are lucky and can force 1:1
interleave.

Want an adaptec mfm bridge card? offer me cool swap & postage or real cool
swap, I'll absorb the postage... Myself, I'm using the adaptec RLL card
with a Mac Plus and a Maxtor brick sized 140M mfm drive = nice 240M of
rll=> scsi

The 16M partitions for the 1040st were a pain= put a 40M scsi drive in b4
I gifted it to the composer friend (so nice NOTATION music software for 1M
1040ST's is a GOOD swap... even magic cable "backups")

That's it... IDE cards for atari's are made but are $$$$

Look for the near dead/dying external 20M atari drive-- it's the HD that's
dying... the magic atari<=>scsi card is prob fine... Even a dying power
supply can be worked around, but you'll end up with your 1040ST sitting on
an XT case (like my Mac does) (well maybe your external cases are BIG)

Cheers... B/H..

The C-Lab mods won't allow me to do that if I have an external drive
connected :-(

>Ensure you don't have long stubs coming off of your scsi cable.

OK

>Have you tried booting with only one of your scsi devices connected to the
>scsi bus?

Yes - the internal drive only, which used to work fine until I decided
to add an external Zip drive, which is when the problems first
appeared.

>I'd be inclined to suspect a scsi configuration problem before a fried chip.
>
>I've been having intermittent scsi problems on my Falcon ever since I
>attached an external case with a disk. I suspect cable impedance mismatch,
>but I never got around to fixing it.

The Falcon doesn't find the internal HD even when there's nothing
attached. This has only been a problem since I attached an External
Zip drive, and as Robert Schaffner pointed out - it looks like the
C-Lab modifications to the Falcon MKII's SCSI do not support external
drives - they removed the resistor packs and replaced with a cable
that goes to the HD, but nowhere inside the machine have they put
additional termination.

I've bought a SCSI chip from System Solutions and I'm going to have a
go at fitting it over the weekend.

Thanks for your suggestions, I'll report back here on Monday if I was
successful ......

Jim

Get the KGMD or KEMD kits.

KEMD is the English translation of Knarf's German MiNT Distribution & either
of these should contain what you need to get a reasonable setup in a short
space of time.

Some of the included packages (notably MiNTnet) are out of date.

> My main goal is 'just' to get MiNTNet running, together with an httpd.

I think you should try to find the latest versions, try umich or
the nic.funet.fi archive.
> BTW, is there some sort of MiNT FAQ (up-to-date please) somewhere
>available ?

I recently setup MiNTnet & all of the FAQ's I used were a little outdated, but
I was able to get it going relatively easily.

If you get stuck, just ask.

First off,

Why would you want one? They are not well supported in the (albeit
small) industry, they only allow one video mode, and that in only 16
colors.

You're far better off getting a Nova, Crazy Dots, or Cyrel Sunrise, in
that order. The Nova you can still get new from Homa Systems in Canada
(and probably a few other places), the rest (including the AlberTT)
you'd probably have to get used from someone.

Good luck!

Dan

> to worry about:

That's right, but read the bit format of the return of
XBIOS call, show this limit.

For information, most of software wrote in high language,
have some internals functions wich calculate a date from
10/01/1970 to 12/31/2037: that's silly cause they couldn't
benefit from the GEMDOS's limit.

By the way, the real limit comes from the NVRAM who are
in the computer: fo Falcon, it's the date of starting up plus
100 years, so more than 2092: that's good, isn't it?

Arghhh, je me suis cru a l'ecole et en plus je vais
me prendre un carton (comme d'hab :-( )
Sacha,

I had a VGA mono monitor working as a ST high res monitor back along. I had three VGA monitors and tried them on my multisync cable with the switch set to Mono. Only one worked with the ST and the framing was offset with a border at the bottom. Also the borders didn't look particularly straight around the edge. I've read that you need to get inside a monitor and adjust a few pots for ideal results. I think theres about a 2Hz difference between VGA and ST High. Something like 70 hertz to 72 hertz or vice versa. So even if your VGA monitor doesn't work straight away a few adjustments might bring it back into line. It was an IBM vga monitor that worked by the way, a damn ugly one.

I've been using two IDE hard drives with my Falcon for some time. A 120 MEG 2.5 internal and a 3.5 170MEG external with no problems except that I didn't install a driver/boot code on the external as it kept booting up before the internal which meant the internal was recognised. The internal drive has the hddriver in the Auto folder so that the external drive is recognised. Its something like HDdriver 6.0 I use. I've also got a EZ135 connected on the SCSI 2 and all three drives work well together. Yes I know I should just get one big internal drive. Oh yes I use an old Spectrum Plus 3 power supply to power the external.

While I'm writing isn't Running great! Not that I'll be registering but I've enjoyed playing the shareware release.

Also wanted Falcon and ST contacts in the UK

Write to Martin Wilson, 32 Grass Royal, Yeovil, Somerset, BA21 4JW.

Lots of software available five disk boxes worth. Plus lots of other stuff. Write now!

My access to the internet is intermittant. I'm on it at the moment on the Mac (bearable but not desirable)

> to worry about:

Actually the GEMDOS time fields reserve seven bit for the year, thus the highest number can be 111. GEMDOS convention is to treat this number as an offset to 1980, therefore GEMDOS is in trouble before 2099 : It's 1980+111, being 2091.

Another possibility would be the shifter chip inside the "large" metal box
on the motherboard. My first guess is that it is a memory problem.

the largest number that can fit in an (unsigned) seven bit number is:

binary: %1111111
octal: @177
hexadecimal: $7F
decimal: 127

As an offset from 1980 this is (1980+127) 2107

(Where does your "111" come from?)

I believe Graphic Workshop for the PC will handle this. You can get the shareware version from www.shareware.com or www.filez.com. You'll have to put the files on a disk the PC can read, but that's no big deal.

Why did you put HDDRIVER in the AUTO folder. The usual place for a
driver is in the root directory of the boot drive where it gets
installed by the driver's installation software. Starting the driver
once again from the AUTO folder makes no sense except for very special
applications.

> au CP/M. La routine TIME.C semble indiquer que l'ann e 2099
> serait la limite pour GEMDOS:

```
> extern int time, date; /* declared in fs.c */
> if ((d >> 9) > 119) /* Warranty expires 12/31/2099 */

Once compiled ,in the roms, this gives :
asr #8,dn
asr #1,dn
because the date is considered as a SIGNED int !!!
(should have been declared as SHORT)
so this generates a BUG because the comparison
with 119 ($77) is always good when bit #15 is set !
(it ends with a comparison between $fffx an $0077)
it should have been unsigned int which would have
been compiled as LSR #x,dn........

SO, the real limit is effectively $7f years,
which is 1980+127=2107 !!
The 119 comparison doesn't work !

If you are using the TIME function in C language
this gives a max date of 1/1/1970 + 2^32-1 seconds
which is approx. 2106 !!! that nearly matches gemdos 'limit' !!

Regarding to the NVRAM capacity , you should know
that it supports two operating modes : BCD and BINARY
which means that if you use it as a relative 'date offset'
you can either have startup+99 years (2079
starting at 1980)(BCD mode) or startup+255 years
(2235 starting at 1980) (binary mode) but the day-of-the-week
value could no longer be valid (because based on a 1900 startup)
(but almost nobody uses it ??)
If you use it as absolute date (which IS NOW the case) the limits
are obviously 1999 (1900+99 BCD mode) and 2155 (1900+255 Binary mode !)
```

To be more precise, the gemdos limit is 2107
but the NVRam limit is 1999 (because used in BCD mode)!!!!
Like under all other systems using nvrams !!

As you can see a compiler bug isn't always that bad ;-))
Hardware limits are WORST !!

so long,
DAVID GODEC

Well, one of the authors of STOS has released a number of "simular" products
on the PC - The "Click'n'Play" series, and there is a new one out (sorry,
cannot remember the name). However, I wouldn't really describe these as
"good" - but maybe suitable for your purpose...

There is currently a project to create a STOS like language on the PC
(working title is TGC). This certainly hasn't reached a stage where it will
be of use to you, but interesting all the same.

But that's OK, because once you know the proper location for all of
the files, it's easy enough to do a one-for-one replacement.

I'm getting really fed up with Netscape 4.0 users who post this HTML
crap with every post.

I'm now forwarding every single HTML post I get from usenet directly to
webmaster@netscape.com. HTML in usenet is against netiquette, against
RFCs and a waste of bandwidth. It just shouldn't be allowed by the
software.

I assume that since I don't see this except when I view source, that it is purely an issue of expense to download. How much are you paying for your service? Maybe we Americans are spoiled. I don't really notice the download lag and of course unlimited access for $20 or less is common.

What's the point of sending all that info, anyhow? I never see all the "neat" formatting.

3131. Atari 520ST for trade/sale!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-19 00:00:00 UTC
From: Daniel Woodard <woodardd@dma.org>
Message-ID: <62cve3$ui0$3@sally.dma.org>
Source record: 15466

Hi! I've got an Atari 520ST for sale, or trade. The system was working fine, but the video went flaky on me. For all I know, it may very well still work ok if you have a monitor, but I don't have one, so it is useless to me. The system would be good to try with a monitor, or to scavenge for the floppy, keyboard or power supply. (this is the STFM version, with internal power supply)

Make me an offer. I prefer cash, but would also consider 800XL stuff for it. I'm especially looking for an 800XL terminal emulation cartridge that does VT100 emulation.

Dan

Source record: 15470
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings..

I'm having some trouble with my setup. It was working just swell, but I decided that it was time to backup everything and repartition my drives (if it ain't broke..). Well, after doing so, Cubase Audio Falcon doesn't work!!

Strangely enough, the ADATREC program that records from the ADAT interface DOES work! The audio is fine from that program. But when I try and load a file into CAF, bomb city.

I'm using the following (although disconnecting everything and running with nothing in the auto folder didn't help):

14 megs RAM
1 gig Toshiba drive
2.1 gig Seagate drive
jaz drive
HDDriver 5.10
CAF 2.06
NVDI 3
Screenblaster 2
FDI init
SoundPool ADAT interface
Steinberg FDI

When I repartitioned the drives, I partitioned them into 400 meg partitions using HDDRIVER, with the 'minimum sector size' checkbox checked. Before, I had 255 meg parttions. I even tried repartitioning one of my drives to 255 megs, to no avail.

Are there any SCSI settings in HDDriver that I could have screwed up? There seem to be no other SCSI problems, as copying files works fine, as do all other programs I've tried running from SCSI..

Is there anything I may have forgotten? Is it possible I have a funky virus? Can anyone point me in the direction of some good anti-virus software for the Falcon?

Any ideas would be greatly appreciated!

-Mark

3136. Megafile 30 Died! Help!

3137. Disk<-->ICD<-->Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-21 00:00:00 UTC
From: michael@fastlane.net
Message-ID: <62h5gf$o3t@news.cybernews.net>
Source record: 15472

Hi all,

Before I go and do something like damage my Falcon, I thought I'd better ask if around to see if I'm asking for trouble. I want to transfer the files from my old hard drive on my STe to my Falcon. I don't really want to open the case, so will the following work?:

SCSI Drive <-----> ICD AdSCSI+ >SCSI Port<------> Falcon SCSI II

Nothing will be connected to the ACSI side of the AdSCSI+, so all I really want from my AdSCSI+/FAST Case is to act as a power supply and not do something goofy to the SCSI bus.

All help greatly appreciated,

Mike White (michael@fastlane.net)

Hi, I'm having trouble trying to connect up multiple hard drives and a CD-ROM drive to my STE. I have a the Link 2 with ICD software. It works fine with just one drive (CD or HD). But if I try to add more it says ICD adaptor not present and I can't get into any drive. I've tried the altering the terminations, and swopping the drives location and IDs, but no success. They are definitely all working individually.

Can anyone help ;-(

Thanks for the response Uwe and Fpinto..

Actually, I solved this problem myself! Believe it or not, CAF 2.06 will NOT WORK PROPERLY with the latest version of MROS (at least not on my system). After messing around with my system for days and not getting CAF 2.06 to work properly, I tried earlier versions off floppy.. they all worked! So I knew it was something in my Cubase setup. I had updated a few drivers in my MROS folder (including MROS 3.43 to 3.45) and when I went back to the earlier version, all is well. I can't believe it.. how can the latest version of MROS not work with CAF?

Anyway, beware when updating..

Uwe, how can I update from HDDriver5.10 in the US? I read somewhere that Computer Direct wasn't handling that anymore.. true? If not, can I get it through ATY computer in Oakland, or do I have to order overseas?

Hmm, Seven bits means 127 values which gives use to 1980 + 127 = 2107 :)

Link 2 uses the scsi bus lead 26 (TERMPWR) for it's own power. If it
responds "adapter not present" I'd guess that, for some reason, the
drives are not putting power on lead 26.

Hmm ... it's not obvious why! Are your drives set to "derive TERMPWR
from power supply" and "put TERMPWR on bus"? Maybe one of the drives
is just shorting TERMPWR and thus depriving Link of its juice.

2100? Perhaps because that's not a leap year, but the Atari system
(both Gemdos and Falcon's RTC chip, don't know for the IKBD) will think
it is.

Re: http://www.users.zetnet.co.uk/rgoring/support/

The above site has been set-up by Roy Goring to feature as updates for
and amendments to the ZetPack.
This page calls itself "The Zetnet Atari Support Page".

UNDER NO CIRCUMSTANCES should this page be confused with the Official
Zetnet Atari Support Page located on AIBS.

Despite a SEVERE case of toe-treading which is somewhat tolerable
considering the very nature of the intentions, there is no reference to
the Official site, no mention of this being an unofficial update site, no
link to the official site, no mention of official user support, no
information of the official line on any of the software plus despite
claims is actually distributing older software than the official site.

This is exceptionally unacceptable and cannot be tolerated.

Therefore please consider this informal notification to Roy Goring to
amend those pages in question appropriately and not to promote them in any
other light than that that they ought to be.

I would be grateful if this could be posted into zetnet.help.atari for me
as I have no access to that newsgroup at the moment.

I appologise for the length of this announcement but it IS relevent and in
my opinion reasonably vital.

Queries to be directed to dhend@zetnet.co.uk or
owner-zetnet-atarians@spodden.zetnet.co.uk please.

yours etc.

Mark, you may have already tried this, but I've had a very similar
problem with CAF which appears to be down to a corrupted DEF.ALL file.
Running CAF with the DEF.ALL renamed or moved elsewhere will prove
whether or not this is what the fault is. All you then need to do is
create a new DEF.ALL file with all the correct settings, or use
DEF.BAK as long as you have one which isn't also corrupted.

Just to be on the safe side I keep a working DEF.ALL on a floppy -
this always seems to happen after I've been doing disk maintenance or
archiving files.

HTH,

Jim

If you talk about the Motorola Real Time Clock (with NVRAM) chip,
there is no such limit. The start year is 1968, there is one byte for
the year (used as binary value not BCD), so it could go until 2223 if
only the Gemdos could drive so far. So the limit is still Gemdos's 2107.

Bye, Bruno.

>of 1/1/1970 + 2^32-1 seconds which is approx. 2106 !!! that nearly
>matches gemdos 'limit' !!

Depending on the library, many C compilers go until 2037 only,
because the seconds count since 1970 is a signed long.

>Regarding to the NVRAM capacity , you should know that it supports two
>operating modes : BCD and BINARY

If you talk about the Motorola RTC chip as used in the Falcon, it's
working in binary mode.

>which means that if you use it as a relative 'date offset' you can
>either have startup+99 years (2079 starting at 1980)(BCD mode) or
>startup+255 years (2235 starting at 1980) (binary mode)

It's used by Xbios as starting in 1968, in binary mode, giving a max
year of 2223, limited by Xbios (and Gemdos as well) to 2107.

>but the day-of-the-week value could no longer be valid (because based
>on a 1900 startup) (but almost nobody uses it ??)

The day-of-the-week value is valid if you put in a valid value ;-)
It's only a counter increased every day, and going back to 1 after 7.
You can change it simply by writing the relevant byte, without changing
any other value. BTW 1 seems to be Sunday.

In fact the RTC chip has no base year by itself, it's just important
that the given year is leap (to keep next leap years synced). It's the
way it's used by Atari ROMs that give it 1968 as start year.

>If you use it as absolute date (which IS NOW the case) the limits are
>obviously 1999 (1900+99 BCD mode) and 2155 (1900+255 Binary mode !)
>
>To be more precise, the gemdos limit is 2107 but the NVRam limit is
>1999 (because used in BCD mode)!!!! Like under all other systems using
>nvrams !!

Really? You must be talking about something else, because all this
is false or unrelevant in the case of Falcon's RTC.

Bye, Bruno.

3150. Atari St monitor to PC?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-21 00:00:00 UTC
From: Sebouh Gueyikian <sgueyi1@uic.edu>
Message-ID: <344CFB6D.4775@uic.edu>
Source record: 15485

Hello all,

I have two of the ST color monitors from my old Mega4 St and my 1040ST.
I was wondering if there was any way I could wire these babies to work
on PC's. Does anyone know of any hardware I could buy or would I have
to rewire the cables to get them to run on a PC?

Thanks,
Sebouh Gueyikian
sgueyi1@uic.edu

please e-mail me a response.

I'll even give the best reply a check for $4, it will save me from
buying a new monitor

3151. Atari portfolio club in Texas

Probably true. Then again, the ST has been around for 12 years already,
why should it ever disappear?

%The only (vaguely) important date is 2000 as this will be met by
%a number of Atari users... (but most dont care about date - hell,

My TT boots up with 0/0/1989. (Battery died, I haven't replaced it yet.)

Hi all,
If there is any one out there who is looking to upgrade to a
Atari Falcon then here is the perfect opportunity to do so.
The following is going for ?400 ono.

```
======= The spec ========

Atari Falcon 030
Nemesis
16Mb Ram
127mb HD
Desktopper (Tower style casing & keyboard)
Magic v4 and Multitos
Ease v4
Nvdi v2.5
Blowup Software
2 Atari Jaguar joypads
Wizard Electronics Mouse
Tabby - (Graphics tablet)

======= Extra Software ========

Falcon Specific games all originals

LLamazap
AAzohm Krypt
Ishar Trilogy
Road Riot 4WD

** Other original games that work ***

Sensible soca
Lemings

**** Other software ****

Calligrapher Junior - Word Processor
Super Base - database

In addition to what is listed above I have a number of Shareware titles too ma
y to
list.

**************************************************
EXTRA SOFTWARE
==============
```

I have some serious graphics/DTP software also on offer. All titles are origi
als
and will include manuals, master disks and packaging where applicable.

Calamus SL £70 - 1994 version (DTP)
Da's Layout TC V5 £100 - Vector DTP program
Da's Picture £50 - Image editing software (latest UK version)
Image Copy v4 £10 - Printing/bitmap coversion utility (latest version)

****
EXTRA HARDWARE
==========

Expose Digitizer £150 - Falcon specific digitizer
Tripod/ Falcam / Falcube Software included

MicroVitec MultiSync Monitor - RGB and VGA screen resolutions, perfect for Fal
on.
(offers please)

After Burner 040RC £150 - 040 processor upgrade makes sytem run at upto 80Mhz
when used in conjunction with nemesis.

****

A special price can be arranged if you require everything above. send replies
to

*** Renaud@Zetnet.CO.UK ***
I can also be contacted on Tel 0181 694 2242 Ask for Richard.

Yes the 1980 was just a (silly) example of startup value ...

Sorry, i was wrong :-(
I was reading a Rtc documentation (by Thomson i believe)
when i saw your post i looked at it closer and it is pure
bullshit !! In fact they even say that the binary mode limit
is 99 (it is 255 as anybody can test ...) ...
I will never read Thomson documents again ;-))

> It's used by Xbios as starting in 1968, in binary mode, giving a max
> year of 2223, limited by Xbios (and Gemdos as well) to 2107.

This is wrong, the limit is 99 EVEN in binary mode ....
I just looked to Motorola and also Benchmarq documents
in fact you can put any value in , but it just WON'T get
updated properly when it should ... in the specs the
limit in binary mode is given by motorola to be 0x63
(99) because the chip is intended to be a '100 year calendar'
as they say ....
In other words you can put in 2053 for example but when
it should become 2054 it will loop back to 1968 again :-(
I wonder why they kept this limit ?
So the limit we were searching for is 1968+99 which
is 2067 which seems to be the real atari limit ,
according to Motorola ....

By the way , you were right , day 1 is sunday !

so long,

It really makes very little difference whether the cut-off point
is 2067, 2107 or even the 2099 that is quoted in the GEMDOS source
code - there will be *very* few people making use of Ataris that
far in the future - let alone people who would actually be affected
by the date rolling round to 1968...

The only (vaguely) important date is 2000 as this will be met by
a number of Atari users... (but most dont care about date - hell,
most ST's reset the date to November 1985 every bootup...)

Anthony

Hello!.

I had the same problems on my Falcon until a kind soul told me
that only the last version of ExtenDOS works with MagiC 5... you can
download the right patches (up to v2.3b)on the Anodyne Software's Home
Page:

URL: http://www.cyberus.ca/~anodyne/

Regards.

Daniel.

And this is exactly what the Lattice C manual says. I think we all can
agree
with that it will work longer than most of us will mange to stay alive.
I
think there is more possibilities that a chip or two will brake in that
time
and can't be replaced anymore as it's computer history and Motorola is
probably long gone by then.

CS TeX works fine under Magic on my Falcon, but when I actually
compile my documents TEX.TTP runs full-screehn, not in one of Magics VT52
type windows. In other words, I can't access other porograms through GEM.
Is there a way round this ?Is CS Multi-Tex still available ? What about
Lindner TeX, the archive at FTP.TEX.AC.UK is corrupted.

Curious,
"Augeas"

The Bravo Sierra Web Page has been fixed. If you find trouble with my Web Page, please E-Mail me at bensmith@teleport.com.

Satisfied customers are always welcome back & welcome to get their copy of my free Catalogs.

FREE Catalogs for Classic Atari 8 Bit or Atari ST Computers! Hard Ware, SoftWare & Books/References! In BSC's Catalogs, you may find some thing you've been looking for, Something you might want & something New to you! View Catalogs at: www.teleport.com/~bensmith/bscomputers.shtml. And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to: ftp.teleport.com/vendors/bensmith/ or if you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can't attach files to your E-Mail. I will get back to you after the weekend. Please Direct all Replies Through E-Mail to: bensmith@teleport.com.

I'm looking to trade for these Items for my Atari. I'm looking for CatBoxes for Atari Jaguar, Jag-Links as well as Jag Controllers, Alien vs Predator and even complete Jaguar Systems. If you have what I'm looking for, check my Atari Catalogs for stuff to trade at: http://www.teleport.com/~bensmith/bscomputers.shtml or E-Mail bensmith@teleport.com for a trade.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. So check out my Catalogs!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitor, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse

Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is.
E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974.
Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in

each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations...
At one link you'll find a Web Site with Michael Currents List of
Developers and Others who Support Atari. And Bravo Sierra Computers is
on the list. Also, you can find A list of Atari Support on BSC's Web
Site. The Atari Developers, Sellers & ReSellers of Atari that I go to
for Help.

> why should it ever disappear?

70-110 years is quite a lot more than 12 years - I guess components in
the machines are likely to have died by then - Falcons are dropping like
flies at the moment, and I guess STs are shrinking in numbers...

> %The only (vaguely) important date is 2000 as this will be met by

I also had problems with an ST after inserting a memory board about five years ago

On turning the computer back on, it worked perfectly for an indeterminate length of time, before simply locking up. After locking, the reset button wouldn't work, and it had to be turned off for some time before it began working again.

Over a period of about one month, the time before it locked decreased to almost nothing, making it impossible to do any serious work.

What we found, was that by propping up the MIDDLE of the front of the computer with e.g. a book, the problem decreased, but by that time we had another Atari, so it was

abandoned.

I decided to fix it last year, and found that two of the CPU connections were broken, one of which was the reset line, and from what I've heard, I think that this is a very common problem in Ataris - it's probably caused by the way the motherboard is held in the case.

The computer is now working happily, and I intend to start working it as a file/print server in the next few months.

p.s. I'd be happy to buy broken Ataris, since I'd like to add some more machines to the intended network, and try some multi-processing work.

Solved it. The CDROM - a Toshiba XM4101B - has a jumper marked TERM
which I assumed to be the terminator. It is in fact the power supply
to TERMPWR 26 on the SCSI lead. I have identified the resistor packs
(black comb like things) as being for termination and removed them. No
more problems.

I didn't read the original posting. I assume it's about drive letters above P:? Big-DOS and MagiC support more drives. With MagiC A: up to Z: are supported, with Big-DOS there are even more drives because 1: up to 6: are also supported. So you get up to 32 BIOS drives and this is the maximum possible with a 16-bit word.

There is a small adaptor available at any good Atari dealer that lets you
plug in VGA monitors. Runs around $12-14 or so...

Let me say something here though...if your friend has a choice get the
MultiSynch Gizmo from Chro-Magic, and find a Multisynch monitor that will
let you use all the Falcons native resolutions. If you get a VGA monitor
only, then you will not be able to run RGB programs, albeit they are mostly
games and EuroDemos. You need a Multisynch that goes down to 15hz. Examples
include the NEC II and 3D. Also, Amitech monitors from Software Hut will
work. (they are new and a little pricey though) Your friend will love the
Falcon-its an awesome machine! :)

Right, the best Way to get a nice Display.

>The monitor jack of the Falcon is very different from the standard VGA.
>Are there adapters? Which pins have to be connected?

You need a special Adaptor for VGA-, RGB- or an SM124/SM1224 Monitor.
You found a lot of schematics in DOITF030 HTML.

Yes, you are unfortuate that a disc error is occuring at a very
strategic place! You need to be able to re-write the boot block for E:

Have you got Diamond Edge or the ICD format program? Both of these
(and, maybe, some other utilities) will allow you to write limited
(partition info only, boot block only) partition info to your HD to put
it right. If you're familiar with boot block structures you could
probably do it with a (physical) sector editor but regard this as a
last resort as you can easily make errors.

It's not a case of "bypassing" anything, m8. You have to write new system components which expect the drive map to be laid out differently.

>because if you do so in magic why not doing this in a patched ROM??

You "do so" in MagiC, Big-DOS etc. by writing a whole new disc operating system not by patching TOS.

True that it comes back to 1968 after 31 Dec 2067, but the first day
of 2068 just write the correct value (100) in the year byte, and the
chip will continue without problems for the next years.

Bye! Bruno.

But it doesnt matter how long into the future the computer handles the time correctly, its a matter of is the software you are using is aware of the difference in time. Even if the computer does 2001 correctly, your checkbook program, or other financial software is very well screwed. Since most of these companies are out of business, you'll never have someone fix the bug.

Someone will correct me if I'm wrong, I'm sure, but I believe that using MiNT you can access drives A: to Z: (but not U: which is special cased) and _I think_ also 1: to 6: (let's think... 26 letters plus six numbers = 32 bits; sounds about right).

Not sure if MagiC allows similar extensions, but bear in mind that you can use MiNT (the freeware, fast part) without MultiTOS (the proprietary slow bit) to get benefits like this, but without being able to multitask GEM apps (you can, however, multitask TOS apps). Surprisingly there are still a _lot_ of people that don't realise that.

Cheers,

Xav

Mine stays "stuck" at the same date (broken rtc chip?). Once in
a while I run "rdate -s" to keep a semblance of reality in the
setup. :-)

Oh, and returning to the topic at hand, if you plan to still be
using your Atari ST/TT/Falcon/Clone past the year 2000, make
sure any date-sensitive apps you may have are either
y2k-compliant or retired by that time. It's nice that the OS is
compliant, but that doesn't help if your apps were poorly
written. (Someone else made that point already, but it bears
repeating.)

Greetings,
been looking for a newsgroup/mailing list/Web site about Networking the ST/TT. Talking to other machines over ethernet 10b2 (Thin co-ax).

Any ideas ??

Regards...Martin

Here's a quick couple of questions I have about this. The _drvbits ($4c2) variable is listed as a 32-bit longword, in ST Internals, and Drvmap(), which is Bios function 10 (see below for the code in TOS 1.62), returns a 32-bit longword in D0 when called, who imposes the P: limit?

Since RWABS will handle any drive that's installed, as long as the driver is there and can handle it, and all the GEMDOS file handling functions go through RWABS, just where is the limit?

Drvmap() code from TOS 1.62

```
E00B86 move.l $4C2(A5),D0
rts
```

It's also in the ST Internals ROM Bios disassembly, with the same code, except at FC08F8.

Hello:

I recently picked up a 1040STF at a Salvation Army, and was pleased because I am somewhat a collector of old computer systems (especially since the games ROCK!).

I thought it wouldn't be a problem to either hook it into my Commodore 1702 composite monitor or to my NEC Multisyc 3D, which I switch off between my Power Computing Mac Clone and my Amiga 600.

Unfortunately, neither one of these scenarios is working. I followed the pinouts available on the internet as best I could but got nothing. When I was initially playing with that alien 13-pin DIN monitor connetor and the 1702, I got a startup screen for a Gauntlet ST disk I have. The initial text looked ok (guess I was in monochrome port) but then the desktop reverted to a garbly looking text.

My initial question of course is this...what other pins are required for a bare minimum composite connection? Do any of the syncs need to be connected? I tried using pin 2 composite and pin 13 ground but get some crap on the screen.

As for the RGB, I will continue to research that but wonder if you could offer some insights. I am very used to cranking out these types of cables for my C128, Sega, etc.

Thanks! (please reply via e-mail)

James

On the Link 2 there is a red LED that should light when term power is present. I had a old Maxtor drive (could have been any old drive) that did the same thing to me on my ST. Wouldn't work with anything in front or behind it. After trying another hard disk, everything worked as it should. Could even be the CD too if it is an older one. Maybe it's age, or maybe the brand. Not very technical, but then the problem didn't follow any known logic:).

3197. 40's clock

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-25 00:00:00 UTC
From: centek <centek@eeb.fr>
Message-ID: <01bce18a$64e077a0$LocalHost@p-d-mou>
Source record: 15382

THE MC68040 AND MC68040V CLOCKS

Some people and some companies, especially french ones, announce
the 68040 to be cadenced at 64 MHz on the AFTERBURNER 040 or on
the HADES 040.
This is totally wrong and only reflects the technical ignorance
about the 68040!

The 040 is cadenced by two clocks: the BCLK and the PCLK.
The BCLK (Bus CLocK) cadences the processor, its bus controller, as
well as the entire calculation unit (and the floating unit for
the 'full' 040, meaning with a FPU).
The Motorola DATA BOOK for the 040 is very clear about it because
on page 10-4, we can read: 'All timings are related to BCLK cycles...'
By all means, when you read the instruction timing tables for the
040, and for example, it says that the XXXX instruction is 4 cycles
that means that this instruction is executed in 4 clock BCLK cycles!!
About the PCLK (Processor CLocK), the 040 needs it to cadence its
internal logic, especially its pipeline.
This clock could be 200 or 500 MHz, which wouldn't change the
performance of the 040 !!
In this case, the PCLK is twice the BCLK with a phase shift + or -
250 to 500 ps depending on the clock generator used.
With regards to the design, you can give a PCLK divided by 2 to get
the BCLK.
A more popular approach is the opposite starting with a BCLK multiplied
by 2 with a circuit to obtain the PCLK.
Motorola proposes a MC88915 circuit, which is also used
by the Afterburner.

A remark : the 040 3.3V model only exists in two versions :
- The 68040V which doesn't have an FPU !
- The 68EC040V which has neither an FPU, nor a PMMU !

These two versions are identical to the 5V version regarding the
performance (otherwise, where are the instruction timing tables of
this 3.3V version in the DATABOOK which talks about ALL 040 models ?!!).
The only differences are the 'LOW POWER' possibilities of this 3.3v
version which are explained in the appendix C of the 040 DATA
BOOK. With the version V (like on the 060 !!), there's only one clock
injected in the processor : CLK (CLocK).
Of course, this clock is equal to the BCLK, located at the same
place on the casing as the BCLK !
So why only one clock and what happened to the PCLK ?
You have to know that the 'STATIC' technology allows this 040 (and the 060)

to be cadenced with lower frequencies, even 0 MHz (no clock at all) in
the purpose to reduce consummation as much as possible...
But, the way to exit this mode is to send a non-masked interrupt to the
040.

Therefore, the 040 (and the 060) has an internal clock control logic which
itself is also cadenced by an internal clock, which works constantly !
Yes, it's this logic which gets the interrupt and exits the 040 from its
'low power mode'. This is also the logic which stops or starts the
PLL (phase-lock loop), which has to synchronize the external clock with
the internal clock ! It constantly monitors this PLL and if unphased,
returns an external signal LOC/ (Loss Of Clock).
This signal, for example, is a variation of the CLK sent to the processor.
The clock can only be modified during RESET or LOW POWER MODE !
In the case of an active LOC, it is necessary to send a RESET to
the processor, restarting it again in NORMAL mode.
Therefore, the 040, as well as the 060 can't (in real time) do an
external DX2 like it is possible on some accelerator cards (CENTurbo
II, CENTurbo I 20/40 (1st generation), Speed Resolution Card, etc...).

Let's turn theory into practice:
Just a little demonstration with a FALCON, an Afterburner 040, and
GEMBENCH 4.03 with the INTEGER DIV test which consists of DIVU.W dx,dx.
We read the timings for this DIVU in the Motorola DATABOOK of the 030
and the 040.
For the 030: 44 clock cycles.
For the 040: 27 clock cycles.
We launch GEMBENCH 4.03 and the INTEGER DIV test (ref. FALCON) on:
FALCON STANDARD 16 MHz: 100 % (normal !).
FALCON + AB40 at 32 MHz: 320 % (411 % at 40 MHz).

Here is the equation, no comment.
68040 at 32 MHz = (44/27) x (32/16) = 3.26 or 326 %

On the one hand, we have the theory with the DATABOOK (if some people want
to interpret the DATABOOK differently, we ARE LISTENING!) which gives 326
and on the other hand, a real test on a machine which gives 320 !
So, the hypothesis for the 040 at 32 MHz is proven correct.
If the 040 was at 64 MHz, like some people would like us to believe,
the gembench test should have been closer to:

652 = (44/27) x (64/16) !

A little bit of COMMON SENSE : why would a processor manufacturer
announce on its processors a clock which would only be half of what the
processor calculates for real ?!! Have you ever seen, a manufacturer
half under-estimating its products against the competition?
Moreover, to not even talk about it in its documentations ??!!!
Us, Never !

CONCLUSION : the 68040 is cadenced by the BCLK !

Rodolphe Czuba
Sacha Hnatiuk
David Godec

My only regret is that I placed confidence in what a person and a
magazine said, so I announced the same crap in the first version
of the PHENIX 040/060 presentation file before discovering the truth
myself (during the PHENIX development).
Unfortunately, a lot of people are still fooled by this falsified
information ! Some even were hoodwinked into buying...

Moral : before believing and/or stupidly repeating the proposals of
others, verify for yourself, or verify it with REAL professionals!

THE MC68060 CLOCK

Some people and some companies, especially french ones, announce
the 68060 to be cadenced at 120 MHz on the HADES 060.
This is totally wrong and only reflects the technical ignorance
about the 68060 and the marketing lies of some companies !

The 060 is cadenced by only one clock : the CLK (that is the PCLK
of the 040 socket !).

You have to know that the 060 is built with the 'STATIC' technology
that allows this 060 to be cadenced with lower frequencies, even 0 MHz
(no clock at all) in the purpose to reduce consummation as much as
possible... But, the way to exit this mode is to send a non-masked
interrupt or a RESET to the 060.

Therefore, the 060 has an internal clock control logic which
itself is also cadenced by an internal clock, which works constantly !
Yes, it's this logic which gets the interrupt and exits the 060 from its
'low power mode'. This is also the logic which stops or starts the
PLL (phase-lock loop), which has to synchronize the external clock with
the internal clock ! It constantly monitors this PLL and if unphased,
returns an external signal LOC/ (Loss Of Clock).
This signal, for example, is a variation of the CLK sent to the processor.
The clock can only be modified during RESET or LOW POWER MODE !
Therefore, the 060 can't (in real time) do an external DX2 like it is
possible on some accelerator cards (CENTurbo II, CENTurbo I 20/40 (1st
generation), Speed Resolution Card, etc...).

Let's turn theory into practice :
Just a little demonstration with a FALCON, an HADES 060, and GEMBENCH
4.03 with the INTEGER DIV test which consists of DIVU.W dx,dx.
We read the timings for this DIVU in the Motorola DATABOOK of the 030
and the 060.
For the 030: 44 clock cycles to execute the DIVU.
For the 060: 22 clock cycles to execute the DIVU.
We launch GEMBENCH 4.03 and the INTEGER DIV test (ref. FALCON) on :
FALCON STANDARD 16 MHz : 100 % (normal !).
HADES 060 at 60 MHz (!): 320 % (767 %).

Here is the equation, no comment.
68060 at 60 MHz = (44/22) x (60/16) = 7.50 or 750 %

On the one hand, we have the theory with the DATABOOK (if some people
want to interpret the DATABOOK differently, we ARE LISTENING!) which
gives 750 and on the other hand, a real test on a machine which gives

767 !
So, the hypothesis for the 060 at 60 MHz is proven correct.
If the 060 was at 120 MHz, like some people would stupidely like us to
believe, the gembench test should have been closer to :

1500 = (44/22) x (120/16) !

Remark : The BUS of the HADES 060 is cadenced at 30 MHz !

A little bit of COMMON SENSE : why would a processor manufacturer
announce on its processors a clock which would only be half of what the
processor calculates for real ?!! Have you ever seen, a manufacturer
half under-estimating its products against the competition?
Moreover, to not even talk about it in its documentations ??!!!
Us, Never !

CONCLUSION : The 68060 is cadenced at 60 MHz (the clock input !)
even if there is an internal DX2 clock !

>FPATCH2

Dave, I have exactly the same problem as you with my Falcon, a C-Lab MkII which has an internal SCSI HD. I had the SCSI chip replaced, but that did no good and I'm faced with a possible repair bill of £100 which could turn out to be a lot more when they actually find out what's wrong with it. A new motherboard will cost about £4-500 or I could try to find a used Falcon from which I could use the parts.

If you have any luck with your problem, please post back here - I'll
do the same if I ever fix mine :-(

Message-ID: <19971025142439263527@toulouse2-38.hol.fr>
Source record: 15387

My turn to have a problem with STinG PPP. It connects (19200bps/V42), negociates and retrieves the IP address correctly, and then hangs up with an 'initializing link' timeout.

I've tried enabling and disabling VJ Compression, just in case it might be the trumpet winsock problem Peter talked about the other day. I've also tried the 60 second timeout version of the dialer, and with and without HSModem07.

This is on a plain floppy driven 4Mb STE with a 28.8K modem.

Any ideas ?

Message-ID: <01bce1bc$d1f002c0$120844c3@p-d-mou>
Source record: 15197

Hi,
The limit of the P drive comes from the
disc driver and not from the Rom, the
DRVMAP function works well , returning
32 bits just copied from $4c2 system variable !!
You can try and put some bits in and you
will see new drives appearing real time in
your file-selector (of course you need some
kind of debugger around to edit memory !) !
The problem doesn't come from TOS but
from poor disk drivers who believe tos
has limits and don't set up properly at boot !!

Hope this helps!

Wrong Cable, wrong or double Termination.
A simple Driver Problem.
No TermPwr. (For external SCSI Devices with active Termination)

>Is my SCSI port dead? I'm using ExtenDOS Pro.

Well, that's the point to find out.

Same as here last week. After a lot of trys i moved all into trash.

Yesterday i take the hole package again, i take the the archive with
the newer modules and the new dialer archive from peters homepage.

I installed all again with the S A M E parameter set as before.

Suprise, suprise..
After the first try i got a connection with 33K6, no hangs, no crashes
but also with no data for CAB or any other client. My ISP don't kick
me out after 60 sec.

This first chance for my to save a DEBUG.LOG before the machine stuck.
PING doesn't work with any Namseveradress or some other Adresses.
I got no data from host.

That is all what i get:

```
LCP -> Doing Conf.-Request :
[01 04 02 40], [02 06 00 00 00 00], [05 06 8d bd 4a
b2].
LCP -> Peer does Term.-Ack.
LCP -> Peer does Conf.-Ack. :
[01 04 02 40], [02 06 00 00 00 00], [05 06 8d bd 4a
b2].
LCP -> Peer does Conf.-Request :
[02 06 00 00 00 00], [05 06 32 6a 79 56], [07 02],
[08 02].
LCP -> Doing Conf.-Reject :
[07 02], [08 02].
LCP -> Peer does Conf.-Request :
[02 06 00 00 00 00], [05 06 32 6a 79 56].
LCP -> Doing Conf.-Ack. :
[02 06 00 00 00 00], [05 06 32 6a 79 56].
LCP -> Link established, starting IPCP.
IPCP -> Doing Conf.-Request :
[03 06 c3 25 09 e4].
IPCP -> Peer does Conf.-Request :
[02 06 00 2d 0f 00], [03 06 c3 25 08 02].
IPCP -> Doing Conf.-Reject :
[02 06 00 2d 0f 00].
```

```
IPCP -> Peer does Conf.-Ack. :
[03 06 c3 25 09 e4].
IPCP -> Peer does Conf.-Request :
[02 04 00 2d], [03 06 c3 25 08 02].
IPCP -> Doing Conf.-Reject :
[02 04 00 2d].
IPCP -> Peer does Conf.-Request :
[03 06 c3 25 08 02].
IPCP -> Doing Conf.-Ack. :
[03 06 c3 25 08 02].
LCP -> IP connection open.
```

After that, a message from my provider arrived..
He found out that i had add some blanks after some parameters. %!)"&#65533;%!/"
Specially password, username ect...

```
So i recheck ALL setup files line by line and i can't found a place
a parameter with a blank behind.

Any suggestions? STinG ad some blanks automatically? :->

>I've tried enabling and disabling VJ Compression, just in case it might
>be the trumpet winsock problem Peter talked about the other day. I've
>also tried the 60 second timeout version of the dialer, and with and
>without HSModem07.

Same as before..
No success. (Exactly: No Data from Host)

>This is on a plain floppy driven 4Mb STE with a 28.8K modem.

Falcon 4.04, MagiC 5.13, but that's not the problem !

>Any idea?

Right, please send your comments to that newsgroup.
Also i think my emailer ist broken, i send emails in two times, but not
one answer of my (simple?) questions ;/

Did you really try ??
I tried to put silly values in the year byte !
In fact you can put anything, it gets written
and can be read back ! But the problem comes
when it must be updated , for example if you
put 0x20 in day-of-the-week (silly isn't it?)
it stays in , but at midnight it loops back
to 1 (sunday) ! It works the same way for
the year byte so i couldn't get 2068 !

Yes, you were probably in monochrome mode. Thhis mode only works on a
monochrome monitor. The machine boots in mono only if the pin 'mono
detect' is grounded. Leave it in the air to boot in color.

>
> My initial question of course is this...what other pins are required for a

There is no composite output on a plain STF. If it was an STFM or STE it
would hhave an RF Antenna outpout for composite video.

>
> As for the RGB, I will continue to research that but wonder if you could
> offer some insights. I am very used to cranking out these types of cables

RGB is the only way to go, I'm afraid.

All the pinout information is available from a few links in my Quick
FAQ. There are also plans for an ST to NEC multisync adapter somewhhere
on the net.

GEMDOS does. It has no internal storage for more than 16 drives and
doesn't expectt more. If there are more, it either crashes or damages
data.
So if you want more drives on your Atari, write a new GEMDOS. IMHO this
doesn't make sense with Big-DOS or MagiC readily available, but if for
some reason you want to do it.have fun with it.

That looks like the same trouble as with fast RAM of the FX-Board(s).
It works sometimes better with some 60nS Simm Modules, but that's not the point.

I think the ram access is too fast. (DMA, Driver or what ever)
I have not the time in the moment.

Okay, whilst I got the specific details wrong, I was sure that I'd
heard somewhere about a MiNT related improvement in this area. Having
dug out my copy of The Compendium, I found the following:-

"MultiTOS extends drive letter assignments to 'Z' drive. Drive 'U' is
a special drive reserved for MultiTOS and is unavailable for
assignment."

Of course, knowing my luck, this information is incorrect and covered
in some obscure corrigendum somewhere, so I'll get slated for
spreading rumours ;)

> Do you have a tool such as ICD's IDCheck?

No. I haven't been very active in the Atari world since Atari World disappeared and my Atari buggered up. I'm now getting bombs loads of times (usually 2 bombs), Stoop's buggered, Autosort's buggered and I can't get any of the Replacement AES's and stuff to work.

I don't know if anyone knows what's wrong or can help. Hint: I've booted from a clean system and it doesn't make a difference, even if I just have FPATCH2

My system is:

Atari Falcon030 - basic unaltered model.
4Mb original board.
210Mb Seagate 3.5" hard disc with adapter.
VGA Monitor
TOS 4.04
In-Out audio connection to my Hi-Fi (sometimes)

Cheers Atari fans!

3224. Mighty Sonic & Nemesis

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-27 00:00:00 UTC
From: MiiTervo@jypoly.fi
Message-ID: <6325t0eob1@mordred.cc.jyu.fi>
Source record: 15209

Is there anyone, who has managed to install both Mighty Sonic & Nemesis, so that they work at the same time? I read the instructions from doitf030 and got it working - somehow. The differencies to those instructions were that I don't have additional clocks for DSP or FPU. Sonic works quite nicely with Nemesis 20/40MHz, but when I enable the TT/Fast ram from Sonic the computer crashed most of the times, when I change the screen mode. With Fast ram enabled the DSP speed test, which comes with Nemesis, won't work. I haven't clocked the DSP atm, as I used the dsp clock wire for Sonic and FPU gets 20MHz.

1) Have you had similiar problems?

2) Can I use the DSP clock signal for both, Mighty Sonic and DSP?

Regards,

Miika

3226. TEAC FD-235HF drive details wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-27 00:00:00 UTC
From: PWest@fortress.org.uk
Message-ID: <3085_PWest@fortress.org.uk>
Source record: 15211

Cross-posted from COMP.SYS.ATARI.TECH:

Does anyone have tech info on the TEAC FD-235HF 3.5" floppy disk drive, specially the jumper settings? This seems to have an extraordinarily large number of selections - the main pin-field is marked A to G and 1 to 4 and has 5 jumpers set. There is a small explanatory diagram besides this that seems to indicate that A1-B1 is DS0, B1-C1 is DS1, A2-B2 is DS3 and B2-C2 is DS3 - would these be for selecting drive 0, 1, 2 and 3?. I suspect so, as the jumper is on A1-B1 and the drive worked fine as an internal DD drive. But are there computers that will take 4 floppy drives? The other jumpers that were set are: A3-B3, B4-C4, D3-D4 and F3-F4. There is a separate J2 that has a jumper across its pins, which are marked F and G, just behind the power socket.

I had been using this drive as my internal drive, but an attempt by a colleague to fit an HD converter did not seem to work. I purchased an HD upgrade plus a Sony MPF-520C drive at the show from TUS and fitted this, and it works fine. In fact installation was easy as pin 18 of the WD controller had already been unsoldered from the motherboard for the previous attempt, so I just had to remove the link that had been fitted; pins 17/18 or the Yamaha sound chip were also unsoldered already as originally a change-over switch had been wired there by Evesham so that I could use the external drive as A: for booting (as the original internal drive was single-sided). I could therefore perform the upgrade without removing the main shielding or motherboard!

As I am not certain that my current Sony 1.44MB external (used only as DD so far) is 100% reliable - I've had occasional reading problems with it - I'd now like to try the TEAC as an external HD drive. My guess would be to move the jumper from A1-B1 to B1-C1 to make it B:, but what about the other jumpers? Also, according to TUS instructions one should run a wire from the HD position of the DD-HD switch to a 3.5mm jack plug so that it auto-switches for HD on the external drive as well. The strange thing is that on the TEAC the switch terminals are marked 5V, ED and HD. I supppose I connect to the HD terminal, but does this marking indicate that the drive will work as an ED drive as well? (Not on the Atari, presumably!). ANY INFO APPRECIATED!

Regards
Peter

3227. Two HDs? ICD AdSCSI Micro ST

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-27 00:00:00 UTC
From: lf.robert@swipnet.se
Message-ID: <877973330.307887@mn8>
Source record: 15212

I just wonder...

A long time ago I build in a HD in a Mega ST 4 with a ICD Micro HD adapter, the adapter had the name AdSCSI Micro ST, it takes its power from the HD.

Some time later I got a 19" monitor, a wonderfull monster, that has a graphics card, well HD and card was a little too much for the Mega ST box, I moved the electronics to a PC midi case and I got a nice and cheap computer.

Now my problem is that the HD is too little and I would like to add a 420 Mb to it but I don't know if it's possible to have two HDs at the same time, just with a cable from the old 127 Mb to the new one.

Both are SCSI HDs with paritet enable.

With Best Regards

Robert

> check it, why do you spread such rumours. Users surely won't benefit
> from them.

Calm down Uwe - I'm not sure if this was meant to sound as damning as
it appeared; I only hope not.

My intention wasn't to "spread rumours", but simply to suggest an
alternative to MagiC or Big-DOS based on what I _believed_ to be
correct.

I think the key word here is "believe". I didn't just have a hunch, or
a vague intching feeling in my little toe - I genuinely believed what
I said to be true or I wouldn't have bothered saying it. I accept that
you are more knowledgable about such things than I am, and am grateful
of your correction to my mistake, but I think it could have been said
a little more tactfully.

Unfortunately I was not in a position to check my information, as my
MiNT setup is currently experiencing "difficulties" which prevent me
getting to my MiNT docs (kept on the minix partition that I can't get
at). Owing to the small size of my HDD, I never bothered to get the
MiNT source. I'm also not really in a position to "experiment" with
repartitioning my hard drive just to answer a usenet question.

In summary, I'm sorry if I confused anyone with my erroneous
information, but I don't think that jumping on me for getting
something wrong is really going to encourage people to share
information in case they're not 110% accurate.

Xav

"Centek" <Acces.Journaliste@wanadoo.fr> said:-

>>just write the correct value (100) in the year byte, and the chip will
>>continue without problems for the next years.
>Did you really try ??

Yes, of course. Exactly I tried the increase until 104 (year 2072)
to see not only if it doesn't loop back to 0 (it doesn't) but also if
the 29 February exists (it does) in the leap years. It works without
problems even after the theorical end of RTC's life.

>But the problem comes when it must be updated , for example if you put
>0x20 in day-of-the-week (silly isn't it?) it stays in , but at midnight
>it loops back to 1 (sunday) !

Is it possible Motorola did different versions of it's Real Time
Clock chips? Because some time ago I've done the test with the
day-of-week byte, and if I write a 8 there it is increased each day
without looping back to 1 until the maximum value (can't remember if
it's 255 or 127).

>It works the same way for the year byte so i couldn't get 2068 !

With a Falcon? It could be interesting to test it with other Ataris
having this RTC chip, like a TT or... I don't know if the MegaSTe has
also the same clock chip.

BTW you seem to have Motorola docs I haven't: could you please say
me how works the automatic summer time jump? I wasn't able to test it,
it is disabled by TOS, and the transition dates seem to be wrong for
Europe (something like first Sunday of April until last Sunday of
October).

Bye! Bruno.

So why don't you just write a driver that works?
I recommend those who are reading this thread not to wait for this
driver because it will never be available. In order to support more than
16 BIOS drives the GEMDOS has profoundly to be modified.

If you have had your Falc. stored away for sometime it might have had
some mechanical shocks etc. It sounds as though most of your errors
occur early in the boot-up process.

I suggest you remove the top, keyboard and shielding and have a good
look at the internal connections. For sure the cables to the internal
floppy often come loose. I don't believe there are many socketed chips
in the Falc but press home any you find. Clean up the SIMM connectors
and any daughter board connectors.

>210Mb Seagate 3.5" hard disc with adapter.

What is the adapter for? The Falc talks SCSI2.

HOW TO ATTRACT GIRLS INSTANTLY....Secrets to instant sex appeal

PURE INSTINCT PHEROMONE ATTRACTANT FOR MEN
WILL GIVE YOU AN UNFAIR ADVANTAGE WITH WOMEN
GUARANTEED

(or your money back)!

Everyone knows that some men (a tiny minority) are able to instantly attract women. It used to be known as "animal magnetism". Scientists now say this natural attraction is due to pheromones - body smells that are not consciously detected, but that effect the behavior of others towards the person giving off these chemical signals. It's natures way of attracting the opposite sex. Scientists have now isolated and synthesized two natural Attractants- androstenol and androstenone pheromone. Carefully controlled experiments show they work and have been widely reported on television and in both the British and international press. Androstenone pheromone has been successfully tested on BBC TV's "TOMORROWS WORLD" and by Desmond Morris (Author of "The Naked Ape" and "Manwatching" and renowned human behaviorist) on BBC TV's "Friday Night... Saturday Morning."

New improved formula PURE INSTINCT from ICT Research Technology contains both ANDROSTENOL and ANDROSTENONE pheromone and produces and undetectable scent that subconsciously attracts women to the wearer. PURE INSTINCT is the world's number one selling and the most concentrated (5 - 7 x normal active strength) pheromone spray for men - don't be misled by cheaper (or more expensive) imitations.

WHAT THE PRESS SAY:

* Lowell Ponte, a former consultant on exotic weapons and a Readers Digest science writer, said in an interview that "use of the recently discovered chemical Androstenone should be banned. Congress should pass a law making it a crime to use this chemical to influence voters by making politicians appear more lovable.
- The San Francisco Chronicle -

* "The stuff attracts women like you wouldn't believe"
- Colorado Telegraph

* "And now this pheromone has been marketed, we've tested it - and good grief it works"
- Koave

* "pheromones influence human behavior in a subtle way. Women are attracted to the smell"
- The Daily Telegraph

* "Pure Instinct is likely to produce a state of sexual excitement or
arousal"
- Men Only (Vol. #44 No. 4)

Much of our sales of PURE INSTINCT are reorders from existing users, reports
confirm success. "PURE INSTINCT really does seem to work! The most dramatic
instances have occurred when wearing it at discos. Girls just drift towards
me and start flirting."
-DT Cardiff

"I Knew PURE INSTINCT wasn't a gimmick when one of the girls at work, quite
out of character, started to seduce me when we were alone in the office."
-SD Nottingham

PURE INSTINCT comes in a discreet 15ml pocket roll on container with full
instructions, Ideal for any man who wants to join that lucky few who have
more than their fair share of sex appeal.

30 DAY MONEY BACK GUARANTEE

If you are not 100% delighted with the results from using PURE INSTINCT simply

Yes, I know. But the problem is that if anyone writes something in this group without thoroughly checking it first, a lot of users are going to belive this wrong information.
Look at this "Drive letters beyond P:" discussion. Someone who not even seems to know the difference between GEMDOS and BIOS drives (although this is crucial) says that you don't have to modify the GEMDOS in order to get more than 16 GEMDOS drives like with MagiC or Big-DOS. Now some users will wait for the software he promised, i. e. a driver that allows more than 14 hard disk partitions without having to install Big-DOS or MagiC. Because it has been known for a long time that more than 16 partitions are not possible without profound GEMDOS modifications there will never be such a driver. What you need is something like Big-DOS or MagiC to overcome the 16 bios drives limit.
BTW, I made some experiments several years ago by changing HDDRIVER in a way that it supported more than 14 hard disk partitions under standard TOS. This didn't work at all. There were either crashes or hangups. GEMDOS/BIOS simply hasn't enough internal storage reserved for more than 14 partitions.

Oh what a mess!
Ask C-LAB if they will pay for that joke..

Not ANY SCSI-Bus works in a 'Y' form.
Simple: Read the SCSI-Specification.

If i had an external SCSI2 port, so i will connect somthing..
A logical way, but not with a C-LAB cased falcon..

Regards, Robert

3240. TT Battery Voltage?

Date: 1997-10-29 00:00:00 UTC
From: lockwood@freenet.calgary.ab.ca
Message-ID: <636ckl$or6@ds2.acs.ucalgary.ca>
Source record: 15225

The lithium battery in my TT030 just died.

Now I know that the replacement should be a Tadiran TL-5242/W which is a 3.6 volt battery. The only battery I can find locally with the same connector on it, is a 4.5 volt Alkaline battery by RayOVac, which I got at Macintosh store - nobody, it seems, has a 3.6 volt battery.

Will I fry my TT if I install this? Will the difference of 0.9 volts (assuming the new battery is charged right up) really make any difference to the circuitry in the TT?

Signed, Anxious in Alberta.

I have a problem with my Original copy of UMS2.

The file UMS21040.PRG, 311780 Bytes (?), 16-01-91 got corrupted.
(The file is located on Disk 1)

Does anyone have this file ?

Any help is welcome.

Thanks,
Sacha

You can get SCSI hhost adapters from System Solutions or Titan in the UK
(these 2 come to mind as they have web pages) for about UKP50

As for building one yourself, that's another problem. I don't think the
guys who make these things will be sending you the algorithmes for
making your own PALs.

3244. Mega STe voltage(?) problems

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-29 00:00:00 UTC
From: kennethm@tripnet.se
Message-ID: <99284635_000021_OASIS_NEWS@000021-tripnet.se>
Source record: 15229
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My MSTe has acted strange lately. Sudden lockups, impossible to boot etc. I have reseated all socketed chips and inspected the power supply for dry solderings and now it seems to run again. But this is the third time I've reseated the chips so there is possibly something else that is at fault. When the machine did not boot at all in high res. I tried to start it in medium res. and it worked perfectly!

What's bothering me is the low voltage on one of the +5 volt lines. On the orange cable I get only 4.91 Volts. Is this normal and within working limits?

This machine has always produced interference lines on the monochrome screen and it looks like the video signal is a bit noisy. (The monitor is OK!). A dotted horisontal black line looks solid but a vertical is ok (the TOS desktop rubber band for example). Compared to my other ST and Stacy (with monitor) the picture looks darker and less stable. Any connection to the above?

3251. TT Battery Voltage?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-29 00:00:00 UTC
From: John.Kormylo@7861.conchbbs.com
Message-ID: <9b3_9710291059@conchbbs.com>
Source record: 15236

The max voltage for the TT RTC is 8 volts. It is connected to the battery and the TT using diodes, so that current cannot flow from the battery to the TT or vice-verses.

In other words, 4.5v will not fry anything.

b > BTW you seem to have Motorola docs I haven't: could you please
b > say me how works the automatic summer time jump?

When bit 0 or register 11 ($B) is set, the RTC will automatically increment from 1:59:59 AM to 3:00:00 AM on the last Sunday in April, and from 1:59:59 AM to 1:00:00 AM on the last Sunday in October (one time only).

The default value for this register on my TT is 6 (which, BTW, means that it operates in binary mode, not BCD). However, if you were to reset it on every boot to 7 (using an auto program), that value should remain until the next boot (presumably when TOS resets it).

This is done by writing $B to $FF8960 then writing 7 to $FF8962 (word mode).

I'm looking to trade for these Items for my Atari. I'm looking for
CatBoxes for Atari Jaguar, Jag-Links as well as Jag Controllers, Alien
vs Predator and even complete Jaguar Systems. If you have what I'm
looking for, check my Atari Catalogs for stuff to trade at:
http://www.teleport.com/~bensmith/bscomputers.shtml or
E-Mail bensmith@teleport.com for a trade.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. So check out my Catalogs!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. Hardware
specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141
Monitor, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles,

Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is.
E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974.
Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it

from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

You don't say which Atari machine you have or what TOS version, but it looks
like you have the old TOS. Format the floppy in the PC & then save the Atari
files to the floppy.

The PC should then recognise it's own format, the atari can already recognise
the PC's.

You'll have to save the file onto a PC floppy. The Atari can read this format native. But make sure you use a Double-density (normal Atari) disk, and format it on the PC as a 720K disk.

Ozzy.

3260. ATARI HARD DRIVES

Message-ID: <3458D136.FE8B02CF@EuropeM01.nt.com>
Source record: 15245

Hello out there.
Is there anyone there who wishes to part with a spare Atari hard drive.

I already have one hard drive - a Gasteiner mega drive (from before Sega made them rename it), so I don't need an ACSI converter of any kind. I just want the hard drive.

Does anyone know if a PC hard drive would do here? I think I would need a SCSI hard drive. Is this correct?

I want about 100+Mb of space, or if I buy new I'll probably go for about 1Gb.

Cheers
Gerard

PS. You'll probably need to reply on this newsgroup, since I probably won't receive any direct mail.

3261. harddrive timeout

Source record: 15246

```
-----------------------------------
h0444ruj@student.hu-berlin.de
-----------------------------------
```

Hay boyz�n�girlz,

I just bought a used ST with a 40MB harddrive (LACOM, with a Quantum HD inside). Now I see, that this ?%$%&/ drives driver gives me a �timeout� message every now and then. At the moment, I can�t see any logical behaviour in this, means, no regulary reaction on a special action.

But that�snot all. Sometimes the HD�s �busy�LED goes out, although the disc is still spinning (hear that), and the drive �sleeps�. Seems, as if this happens mostly while writing on it, but also not regulary.

```
Sure is: I tried two STs, same behaviour, also tried different cables. Must
be the HD. While loading stuff from it, every seems to be OK, no errors,
progs are running.

Would be nice to get some support! Thanx for reading this, may Atari live
forever.
>Ben

Source record: 15297

Hi,

normally your PC should recognize the Atari format. Don't use a special hi-formatter, only the original Atari formating routine (no 10 sectors, 82 tracks). Also, don't use HD discs, should be DD.
Hope this works. Ben

3264. Floppy Drive Problem

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-30 00:00:00 UTC
From: Darrel Farris <darrelf@cnet.com>
Message-ID: <63b49ojre1@nntp2.ba.best.com>
Source record: 15299

I'm the new owner of an ST and it came with an Atari SF354 floppy drive that seems to be a bit flaky. The light is on and constantly spinning, but when I double click on the drive icon, it waits and says that the drive isn't responding, etc. I'm not sure if I'm doing something wrong or whether it's just dying a slow death...

Any help would be appreciated :)

Darrel

3265. How to plus a CD-ROM drive on my AdSCSI+ ST

Newsgroup: comp.sys.atari.st.tech
Date: 1997-10-30 00:00:00 UTC
From: Jean-Michel MERCIER <jmmercier@compuserve.com>
Message-ID: <01bce570$7aa89e20$9d4be8c3@grossevache133>
Source record: 15300

Hi !

I own a AdSCSI Plus ST that with a 1040STF
I have ICD Drivers version 6.0.7

I have a NEC 100Mo SCSI HD --> works well
I have a SONY CDU561 CDROM drive (formely a Apple 150 drive)

The IDCHECK utility found the cdrom when it scans but
I don't know how to get a logical unit on it.

Any idea ?

Thanks for your help.

Jean-Michel MERCIER.

The lower PSU limit for TTL type devices is around 4.75 volts. Higher limit
can be around 5.25 volts.

>
>This machine has always produced interference lines on the monochrome

>Any connection to the above?

I have seen something like this on my own Monochrome monitor.
Bad connections on the video lead caused this (NOTE I have my STFM re-housed
in a PC tower, so I had to move the video connector off the PCB).

Sometimes a bad connection will cause some screen data to be lost, the
characters lose definition.

This may/may not be the same as your problem, is your monitor old?

> My TT came with a Panasonic 6 volt battery. I replaced this with a
> standard PC battery pack which hold 4 AA alkaline batteries in series
> (1.5 x 4 = 6 volts)

My first TT (now deceased) had a 3.6 volt battery like that. My current TT came with a 6 volt battery. When that battery died and I was looking to replace it, I noticed that there was a shrink-tubed resistor embedded in the wire going from the battery to the motherboard. (Can anyone corroborate that?) I suspect the reason for the resistor was to lower the voltage going to the motherboard to a more appropriate value. To make a long story short, I ended up using just 2 AA batteries.

Source record: 15304

There is a small
explanatory diagram besides this that seems to indicate that A1-B1 is
DS0, B1-C1 is DS1, A2-B2 is DS3 and B2-C2 is DS3 - would these be for
selecting drive 0, 1, 2 and 3?. I suspect so, as the jumper is on
A1-B1 and the drive worked fine as an internal DD drive. But are there
computers that will take 4 floppy drives?

You are right about A-1 - B-1 being the DSO On the Atari they were cheap and
put DS1 only on the external drive. Atari only allows 2 disks drives on the
system as drive A and drive B..
I have found that Sony and Teac 1.44 drive work just fine in the 720K mode, and
with a few hardware changes such as the Ajax chip will allow you to use the
1.44 format (you will need a formatting program that can format 1.44 with the
above chip.) I have benn using the TEAC drive with the above chip for some
time and never had a problem with it so far. Hope that this helps you out

If an Atari ST doesn't boot with sometimes dark and sometimes white
screen it's normally a memory problem.
If your screen is always green and you don't use a green monitor it must
be something different.

:
: Thanks to all.
:
: Claude Bourgoin

TT RAM chips must be 30 pin 1Mb or 4Mb x 8 non-parity nybble mode SIMMs.
^^^^^^^^^^^^^^^^^^^
The 8 means 8 chips on each memory card, NOT 9 or 3 they will not work.

I purchased my chips through Memory Supersource 1-800-457-6837.
Item # WM4000870S 4MX8 70NS SIMMS

The newer TT RAM boards it will have 6 jumpers labeled w101 to w106.

The jumpers settings are as follows:

w101 w102 w106
1M x 8 SIMMs (4MB) 2-3 2-3 2-3
4M x 8 SIMMs (16MB) 1-2 1-2 1-2

jumpers w103 & w104 are for the start address remain the same 2-3

jumper w105 is for burst mode ON 2-3 OFF 1-2

3278. General TT questions

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-01 00:00:00 UTC
From: tross3@hamtel.tds.net
Message-ID: <63ehgt$n14@news2.tds.net>
Source record: 15313

I've recently purchased a used TT, and I have a couple of questions
I'd like to ask to preclude my opening it up and checking for myself -
it's not in a very electronics-friendly environment at the moment....

1) Nova Card - I see the ribbon cables entering the computer at the
opening for the serial ports - is there a bus in that area? (I thought
I had seen (years ago) that it was off to the side) - or have I lost
my two serial ports because of the graphics card? I ran LISTPORT from
the STiK package, and only saw 19200 bps ports listed - Peter's
SERIAL.CPX shows 2 serial ports though.

2) What is the maximum modem speed without any modifications? The
manual says that it's 19,200 bps, just like on all of my STs, but
then the manual also stated that I only had 720k drives, when I've
actually got HD drives. I accepted the fact that I had to make
hardware mods to up my speed on my ST, but do I also have to do so
for my TT? sheeeesh....

3) I notice people discussing the batteries in their TT. I imagine
that is for a RT clock? Are the batteries standard issue? Just
wondering, because I have a clock cartridge that came with the
computer. Seems like a) a waste of money b) an indication that I
have a very early version.

4) Have some RAM upgrade questions too, but I'm reading what has
recently been posted, and looking for earlier postings in Deja News.

Thanks,
Terry

<Stuff deleted>

I do appreciate what you're saying Uwe, but looking at it from the other side of the fence, not everyone is an expert, and I'm sure there are a lot of people out their with mistaken beliefs and misconceptions about technical details. Taking the example you quoted, I dare say that there was more than one person who didn't fully appreciate the difference between GEMDOS and BIOS drives.

In cases like this, surely it's better for someone to post something incorrect, which is then corrected by the "experts" in this group, such as yourself. By one person openly making an error, everyone who had that misunderstanding is put right. If everyone had to check and double check their facts before posting, I'm sure that we would (a) see a reduced number of posts, and (b) have more individuals with incorrect beliefs about technical details because nobody stuck their head above the parapet and got it shot off.

Let's face it, we've all been in situations where we wanted to ask a question, but didn't for fear of looking stupid. On those occasions when someone else has the guts to look like a fool, and thus get the question answered, we all feel a lot better for it (and very glad it wasn't us looking stupid). It's a similar case here - we need those idiots to make fools of themselves so that we can all learn something from their mistakes. I have no problem being one of those idiots, but there's the danger that if you make people feel _too_ stupid (even when they deserve it), _everyone_ will stop asking questions or making suggestions for fear of being ridiculed - then we all lose out on some very useful information, which would be a great shame.

Cheers,

Xav

Source record: 15318

Hi all,

Since Atari is now incapable of producing new machines, is it likely that anyone else will pick up the torch, and go into production?

Are the details of the Atari circuit layouts, OS, etc. still owned by someone?

If not, could someone start producing new machine, could there be an Atari Phoenix ?!!!!

Besides, would it break 'Atari' Copyright to produce a machine which was 100% compatible with the Atari Falcon, but also had some improvements? (Would somebody enjoy the task of writing a new set of ROM's entirely in assembly language to boost the speed!)

Would it be illegal, for circuit diagrams, etc. to simply be discussed, if there was no manufacturer actually producing the machine.

It just seems that in twenty years time, what today is a fast new machine will be broken, forgotten, and slow, and there will be nothing new to replace it.

So hands up those who are interested in the 'Atari' Phoenix.

Cheers

Gerard

The VME bus is directly behind the plate that holds the two serial
ports. If you're handy with a grinder/cutter, you can take the actual
video card prtion out of the external Nova case and mount it underneath
the hard drive. This requires cutting a port at the back of the TT case
for the SVGA connector and cutting the hard drive bracket (if you have
one) shorte, so the card will fit underneath it. There is still room for
a 1" high hard drive to be mounted to the bracket.

I believe the TT will go to 115K, but only on one or two ports. the
HSmodem package should tell you all you need to know.

> 3) I notice people discussing the batteries in their TT. I imagine

> wondering, because I have a clock cartridge that came with the
> computer. Seems like a) a waste of money b) an indication that I
> have a very early version.

If your machine supports HD floppy, it should have a clock. But, as you
say, people have been looking for batteries, so maybe the TT battery is
dead. I believe it's a standard battery.

> 4) Have some RAM upgrade questions too, but I'm reading what has
> recently been posted, and looking for earlier postings in Deja News.

TT RAM is on a board to the left of center when you are facing the
computer from the front. ST RAM is on the right, under the hard drive.

If you only have two megs of RAM, then the chips are only on the motherboard. If you have 4 or 10 megs, then you should have a daughterboard plugged in under the hard drive.

It's already being done. There are several Atari clones out there:

* Hades / DirecTT

a 68040 or 68060 based souped-up TT clone, running a modified
TOS 3.06 system designed to control PC-standard PCI and ISA cards.
It uses standard PC parts (ie: EDO Ram, EIDE HD, ATI video cards)

* Medusa

a Falcon clone that uses Hades technology.

* Milan

"What if Apple made TOS machines?" is what this one looks like.
The concept is similar to the Hades, but the tower and features
are more in line with a PowerMac 9500 running TOS.

>Are the details of the Atari circuit layouts, OS, etc. still owned by
>someone?

There is also C-Lab who produces heavily modified Falcon 030,
under license from Atari. Their Falcon Mk.X is incredible.

>If not, could someone start producing new machine, could there be an
>Atari Phoenix ?!!!!

There already is a Fenix in progress. It's a complete TOS rewrite
that includes improvements on the serial drivers, AES, BIOS/XBIOS
and support for 3rd-party upgrade cards.

From Colin McDowall

I read in an old S.T. format that it was possible to use a P.C.
Hard with a ST
I would quitelike to know how this is possible.
the drive is an 100 M.B. I.D.E.
If this is possible any ideas where I could get the bits.

Ellis.mcdowall@virgin.net

From: chrisc@zetnet.co.uk
Message-ID: <63infq$i0o$2@roch.zetnet.co.uk>
Source record: 15324

Hi Folks,
I've got a CM8833 Mk1 and I need the pinouts to connect it to my STE. I have an STE to CM8833 Mk2 cable with a 9-pin D-type connector and two phono's on it so I'd really like to converty that, so if I ever get a Mk2 I'll be able to hook that up so a converter from 9-pin + phono's to SCART or 9-pin to 8-pin DIN would be appreciated.... the CM8833 also has to serve my BBC B and my Jaguar (bit of a difference in resolutio9ns but who cares...)...

To address the CD-ROM, you need a commerical program like ExtenDOS, a
CD-ROM driver package that runs about $30 I think.

The adaptor and the SCSI hard drive have different pins, but the ADSCSI
cable that goes between them takes care of that. Do you have that cable?
If not, you'll have to get one... Good luck. :)

You need some software to mount a CD-ROM drive on the system you could use
METADOS or EXTENDOS.

You need a CDROM driver for the system. They go in the AUTO folder, the best one is Extendos Pro, it's what I and most people I know use, the alternative is Metados. Extendos is a commercial program, Metados is freeware, Extendos is pretty damn easy to set up, Metados apparently can be a bit hard unless your used to MiNT, MultiTOS etc....

Hi--

if you find any information on this subject please let me know.

Several years ago (or more) I purchased a AdSCSI ST Series ICD SCSI Host Adapter for an SCSI drive at one of the last Atari shows in Glendale, CA.

Finally deciding to get around to this I added a hard drive I purchased an old Quantum SCSI drive whose pins tun out to be the wrong number. I can tell this is going to be a pain.

If you come across anyone, anysite or anything concerning this subject please let me know. I'd like to install the drive without too much fuss or expense.

Thanks.

> moment thing sassuming that all SCSI hard drives have the same pin
> configuration. However, the pin configuration is different than my ICD
Host
> Adaptor.

What do you mean by "different" ???
Is it a DB25 connector instead of the Centro50
of the Icd adaptor ?
Or is it the Hd itself that has a different pinout ?
It MUST have 50 pins , otherwise it is NOT a scsi drive !
(if you have 40 pins it is more probably a ATA/IDE drive)
If you're talking about the external connector of the
drive external case, it could be a db25 (which is approx.
like a printer connector....), in this case you can buy
an adaptor in any good grocery ;-)
They are often used too for Zip drives (db25)

hope this helps,

>wonder if this has been done? Does anyone know anything about this?

Ahh, yep that was me.

Didn't finish because I got a A/D converter that will lock to Word Clock.

BOTOH, Aardvark makes a adapter for Word Clock to S/PDIF. Now one can might
be able to take apart this adapter and rig it up. The clock signal to the
Falcon is on pin 26 (I think, cause I don't have my text file with me)

Aardvark http://www.aardvark-pro.com

Or the adapter may separate the clock signal from the S/PDIF signal. (I forget)

Regards,

Rich

3302. Pin Problem with SCSI drive

At one of the last Atari shows in Glendale, CA I purchsed an ICD 'The Link' SCSI Host Adaptor which ended up sitting in my drawer after Atari folded shortly thereafter.

But I recently purchased a Quantum SCSI 80 Meg Pro Drive on a spur of the moment thing sassuming that all SCSI hard drives have the same pin configuration. However, the pin configuration is different than my ICD Host Adaptor.

What hard drives accept this conversion kit? Is this a difficult set-up in terms of power etc.

Thanks.

Befuddled

3303. PC Power Supply Question

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-03 00:00:00 UTC
From: xav@compsoc.man.ac.uk
Message-ID: <63lbup$70v$3@irk.zetnet.co.uk>
Source record: 15338

Okay, I finally plucked up the courage to attack my Falcon with a soldering iron and recase it into a PC tower case. Whilst moving the PSU around in order to fit the motherboard in, I had a proper look at the leads coming out of it, which has prompted a question.

Most of the leads are simply power supplies, using fairly chunky cable clearly meant to deliver some current. There was also a twisted pair of cables, red and black, which are much thinner - of a "control circuit" type diameter. They are terminated with a push-on connector on a similar design to the keyboard connection in a standard (all-in-one) ST or Falcon.

What I want to know is what these wires are likely to be. Could they be connected to a relay or similar, for use with the keyswitch on the front panel in order to lock out the PSU, or are they more likely to be an output for the power LED. I would have thought the latter unlikely, but is there any other possibility that I haven't considered, or can anyone give a definitive answer?

Cheers,

Xav

There are talks about someone trying to get the rights for TOS and
the Falcon to produce new more powerfull 100% compatible clones. I
don't know who it is, but it's defenitly someone trying. Apparently
there are problems reagarind who owns what in TOS. Digital Research
are gone so we just have to hope that everything clears up. But as I
said, there is defenitly someone trying to do it. I just hope that
things get settled very soon now, before it's to late.

Medusa is a TT clone, not a Falcon clone - it uses TOS 3.06, and although a soundcard, with optional DSP is available, neither are compatible with the equivilent Falcon hardware - the same goes for the video hardware.

> There is also C-Lab who produces heavily modified Falcon 030,

Yea, Fenix is a complete re-write of TOS, but I would have thought that Centek's "Phoenix" machine (and Dolmen OS) is probably more interesting to the original poster. After all, this is (supposedly) what they are looking for...

Yes, but by the way , did you forget
original Amigas have NO RTC Chip ;-))
You should say "no chip=no bug" ;-)
Anyway the bugs won't come from the
hard nor the system, but rather from the
software apps, when caculating about date
difference ,for example !

I have stuffed all my SCSI gear into an old "Turbo" PC case. There was
a similar connector on its PSU which powered the 2-digit "MHz" LED
display on the front panel. I forget how the Keylock was cabled.

VGA sync is okay for ST High. Just wire red green and blue lines to the ST mono out to get paper white. Multisync is required to get ST color due to the low sync rate. If you'd rather, I have an extra SM124 for sale.

3315. Can't boot from harddisk

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-06 00:00:00 UTC
From: fe@cosa.de
Message-ID: <878804797.3756@dejanews.com>
Source record: 15250

After moving to another city, my old 1040ST didn't work properly anymore. At first when I booted, it ran for about a few minutes and then it stopped. Some strange things I noted were random pixels appearing in some screen lines before it quit working. After a coldboot the same thing happened again.

I opened the case and checked if the chips were properly fixed into their sockets. After reassembling the computer there were no more crashes like described above but, even worse, the computer wouldn't boot from the harddisk. However, ICDCHECK detected the harddisks at the DMA ports and I still can park the HDs. I can install the driver program but when I create a new drive icon and try to open drive C I get the response "drive unknown".

I guess that could be a hardware problem, but I don't know what components on the board are involved.

Cheers

Jens

Are you sure you have created a drive with an upper case C? A lower case c is a special case and refers to the cartridge port.

Michael

3318. Megafile replacement fan?

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade. I need to test the Mega 4 ST before I pay. I was recently burned by an old friend who said the Mega worked. He couldn't refund my money. I can't afford to be burned like that again. Please do not reply here as I dont read message bases. Please direct your reply through E-Mail to bensmith@teleport.com or call Ben at: (503)256-9974.

P.S. I'd need to keep this transaction solely in the United States.

E-Mail bensmith@teleport.com for a trade.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. So check out my Catalogs!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. Hardware
specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141
Monitor, Atari 1050 Disk Drives, Atari 1050 Happy Drive, Indus GT Smart

Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads,SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST & Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is.
E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974.
Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

3321. TT, Falcon, and TOS ROM ?'s

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-06 00:00:00 UTC
From: horseman@nospam.xmission.com
Message-ID: <horseman-0611971818230001@slc109.modem.xmission.com>
Source record: 15256

Hi all,

Forgive my ignorance, please, but I've been out of the Atari scene for a while.

The TOS ROMs that come with the Falcon are sometimes referred to as
MultiTOS. I take it this version of TOS has built in multi-tasking
support, correct? Can these TOS ROMs be used in the TT030 as well, or are
they Falcon specific?

Assuming they Falcon only, what multi-tasking add-on software are
available for the TT030?

Any recommendations, tips, etc. gratefully appreciated.

Wrong. MultiTOS is a software TOS that runs on top of MiNT, the
multitasking unix-like kernel. If you boot with plain TOS 4.0x (falcon
TOS) there is no multitasking. You need to set up an alternative
software based TOS such as MagiC, Geneva or MiNT.

Anyway, TOS 4 is falcon specific, TOS 3 is TT specific, no

> Assuming they Falcon only, what multi-tasking add-on software are
> available for the TT030?

The 2 mainstream approaches are either MagiC or MiNT with an additional
AES (MultiTOS or Naes or Xaaes or Geneva...).

Thanks for the responses, guys.

How is software compatibility with Magic or Mint? Is it true I'll need some kind of multi-tasking environment to use the PPP (TCP/IP) dial-up networking software?

Thanks again for the help.

Hello again,

I'm going to really start publicing ICTARI properly now.

For those who don't know, ICTARI is a disk-zine / user group
for Atari programmers. You can read, download and contribute
to the zine on the WEB:

http://www.elis.demon.co.uk/ictari/ictari.htm

If you know any keen programmers not on the 'net, I'd be
grateful if you could print this out and give them a copy.
Why not take it to your local user group meeting ?

Thanks,
"Augeas"

useful programs for programmers etc, etc. The service itself is completely free, members send us a blank disk each month and the postage (or the cash equivalent) in return for next month's disk.

If you are an experienced Atari programmer, the group would very much value your programming expertise, however, this does not mean that we would expect you to provide programming articles, tips, etc, for each disk. If each member only contributes two articles a year we would have enough material to fill a disk each month, and if you decide to join the group we would hope that you could occasionally send in some contributions for the magazine. The sorts of material we try to publish are programming techniques, useful sub-routines, C functions, BASIC procedures, MACROs, etc, which would be of interest to other members. You may also be able to help other programmers with software problems and there may be other members who could help it you with a software problem that you have, after all, even experts don't always have it all the answers.

If you are a beginner to programming or are just starting to learn a new language we can probably help with any software problems you have as we often run tutorials on various languages and programming techniques. If you have any programming queries, please send them in (on disk if possible) so that other members can hopefully provide a soloution for you.

We trust that you will consider becoming a member of the group and provide some useful input to the magazine occaisionally. If you are interested perhaps you would fill in and return the enclosed questionnaire to us at the above address. To recieve the next issue you will also need to send a double sided disk together with two 2nd class stamps or 75p cash for each month. Please return these as soon as possible so that we can place you on our mailing list for the next issue which will be despatched about the 15th of the month. The questionnaire and latest issues are also available from the ICTARI WEB page. Cheques or postal orders should be made payable to Mr G. R. Greenway. Back issues are also available for 1UKP each.

If you decide not to become a member we would be grateful if you would pass this letter and questionnaire on to someone who may be interested.

We hope that you will agree to join the group, we are sure you will find something of interest on each disk and for just a few pence a month can you afford to miss out on the chance ? We look forward to hearing from you in the near future.

Unless their bearings are damaged, they're not the culprit. You can
cut away the ventilation lattice in the case in front of the fan,
which reduces the noise quite a lot. You can also solder a resistor
into the fan power supply line, which makes it blow a little less,
which is compensated for by the removed lattice anyway, so no worries.
I'm not sure however on the proper value for the resistor. This depends
on the type of fan that is used in that machine. The voltage rating
is probably 12 V, make a measurement of the current drawn by the fan,
and I'll tell you which resistor to use.

Good. GEM programs generally have no problems at all with multitasking. Some non-GEM programs have problems, but others work ok.

> some kind of multi-tasking environment to use the PPP (TCP/IP) dial-up
> networking software?

The most stable solution for PPP is to use MiNT-net - which is MiNT
(or MultiTOS)
specific.

I believe that STinG, which supports singletasking TOS versions, provides PPP, as does PPP-Connect (Magic only?). Unlike MiNTnet, these do not have stable ports of the popular unix networking tools.

They were never referred to as MultiTOS. MultiTOS was always a RAM based
product.

> support, correct? Can these TOS ROMs be used in the TT030 as well, or are
> they Falcon specific?

Falcon ROMs are Falcon specific.

> Assuming they Falcon only, what multi-tasking add-on software are
> available for the TT030?

The MagiC multitasking operating system (English version available from
System Solutions) is what most Atari users have as their multitasking
environment nowadays. It runs on Atari ST/STE/TT/Falcon.

No,no,
it's just TOS 4.0x (4.04 for the latest Roms)
No multitasking inside ....
Multitasking is provided externally using
multitos/mint or Magic !
And these work on the TT as well :)

Most modern software is designed to be used on these systems. Problems
occur mostly with older stuff.

As for PPP software, STiNG or STiK don't require multitasking. PPP
Connect (that comes with CAB 2.5).

Dr. Uwe Seimet,

I find the Geneva works better than MagiC for hard to handle older software.
Geneva even runs on the Hades.

Hi Simon,
Just about any kind. I seem to remember that some SIMMs with 3 chips might
not work so you should look for SIMMs with 8 or 9 chips to be certain. It
doesn't matter if they're with or without parity, since the STe ignores the
parity bit and can use both types.

Best regards,
Claes

3340. DMA STE problems with hard disk...

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-08 00:00:00 UTC
From: Rolland <eagle.flight@videotron.ca>
Message-ID: <3464A8C4.537C4C67@videotron.ca>
Source record: 15275

Hello!

I'm a new user in this newsgroup, so maybe I wont follow all the 'procedures' but I'll try to do my best.

Actually I have a problem with a 1040 STE machine that have the 'buggy' DMA chip, the one that make some write errors on the hard disk after a few hours of working.
So I have to replace this chips but I need some information about the family of all available chips that could replace this faulty chips.

So could you tell me what are the numbers of any DMA chips that could do the job wright. I have a lot of broken machines in which I could take the good chip: 520 ST (Tos 1.0), 1040 STE with soldered DMA, and 1040 STFM.

I need any information about a replacement chip that could resolve my problem.

I thank anybody that could give me some help.

Bye!

Rolland Collin

A 3.x based TOS supports only TT machines
A 4.x based TOS supports only Falcon machines.

MagiC 5.x as 'multitos' works fast and fine on both machines.

This is probably a silly question, but I'll ask it anyway.

What is the frequency tolerance for the vertical and horizontal syncs?

I'm asking this since there must be a specified tolerance. After all, there is less than a 1.5% increase in horizontal sync when the vertical sync goes from 70 to 71Hz or from 71 to 72Hz and, on top of all that, it would be nice to know.

3347. Seagate 2GB disc shows up as only 1GB - what's wrong?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-09 00:00:00 UTC
From: mb@tos.pl.net
Message-ID: <WP4RCDD@tos.pl.net>
Source record: 15282

After installing a Seagate "Medalist" 2GB SCSI hard disc drive into an Atari Stacy computer, the drive only appears to be 1GB in size.

When partitioning the disc (with HDDriver version 6 or Diamond Edge version 2) the disc only appears to have 1GB of space. While the disc works correctly in other respects, it is unfortunate that only half of the disc space is available. Formatting the disc with HDDriver does not make any difference.

The ICD hard disc software indicates that the disc size cannot be determined, when attempting to partition the disc. After this message appears the disc cannot be partitioned with the ICD software.

When attempting to partition the disc with HDX, HDX indicates that format parameters are not present in the root sector and that the disc should be reformatted. But attempting to reformat the disc with HDX results in an alert stating that the disc cannot be formatted, and that the connections should be checked.

What is wrong here? How can I correct the problem so that the full disc space is available?

Your assistance would be much appreciated.

f>
f> I have tried to save the file on an Atari floppy but my PC doesn't
f> recognize the format...

Simple! Format a DD disk on the PC (in DOS, if you like), copy the file to it, and the Atari will read it. Ataris read PC-formatted disks, but disks formatted on Ataris with old TOS (before 1.04) have the first 2 bytes different and PCs won't read them (later TOS versions are OK). There are also Atari PD programs that will write a PC-type boot sector on an Atari-formatted disk (IBM_BOOT.TOS for one).

h> E2 to E1 for HO HD out on pin 2

I want to use it as my external B: drive, so do I bridge A2 to A1 or what?
And does the last line mean that the HD detect is brought out on pin 2 of the
Shugart bus, so I don't need to run a separate wire to the HD-detect switch
from the HD adaptor PCB (via a jack socket in my conversion)?
Also, does this TEAC drive also do ED (as apparently marked on the detection
switch - mentioned in original query)?

Could you perhaps let me have TEAC's email address (or snail-mail) so that I
could get hold of a copy of the spec sheet. please? I don't have a working
fax, so perhaps they (or you?) could send it snail mail.

h> I've successfully used a Sony 520-1 (seems like it's a deriviation of
h> your Sony 520-C), but just about all modern HD disk drives should work
h> if you connect them correctly to the ST!
h>
h> Download a file I've made explaining all the details. Hopefully it'll
h> help sort out the problems:

Yes, I have that file - very useful too. The drive originally worked fine as my B: drive, but as I said it now shows occasional read problems. I suspect that one of the heads might be out of position or a little loose, or perhaps just on the limit of tolerance so that sometimes it reads the tracks OK and other times it doesn't. As I said originally, it may depend on how often a program tries to repeat a read...

> SVGA (some) | 35.5 KHz | 70 Hz

I'm pretty shure you're wrong about this. Standard ST has about 71 Hz Vsync and about 31.5 KHz HSync. But this is not so important, because:

- most (S)VGA monitors I have seen support horizontal frequencies of 31.5 and 35.7 Khz. After digging into my old Phillips Brilliance for example, I discovered small board with two banks of monoflops, which was used to recognise input HSync as one (31.5 KHz) or another (35.7 KHz) and switch one of two sets of picture adjustments. It is easilly possible to move around these frequencies by turning factory-trimmed trimmer potentiometers. One should be carefull with this, since it can cause overheating and even loud explosion of main deflection transistor (among other possibillities, but the most probable). This can also change radiation rate of the monitor (UV, X-rays, whatever), but I wouldn't worry about that. If the picture is not to bright (you trimmed sub-bright accordingly), everything should be just fine. Even under worst settings (most radiation), don't expect to see your skelleton picture on the wall behind you.

I used to arm myself with several BU 508's (transistor 1500V, 15A, if memory serves me right), and after going too low with HSYNC deflection trans. (usually 2SC.. something or often even BU508) said BOOOM! I've just replaced it with fresh BU508 and I was ready to go "where no man have gone before". But just to calm you down, you shouldn't worry too much about measly KHz or two, I was speaking about trying to run VGA monitor at 15.625 KHz !

I wouldn't worry about VSYNC, since it can be usually trimmed in much wider area than HSYNC deflection rate. Most monitors I've seen can be trimmed from somethin little below 50 Hz to at least 80 Hz. This is because rates are so slow that currents and voltages across vertical coils are much more easilly handled.

Just a suggestion, the best candidate for ST is not VGA, but EGA monitor! Why?
Well, for one they can be bought very cheaply, and they ussualy support also CGA mode (which means 15.6 KHz !) and EGA refresh rates are

sufficiently close to the ST monochrom. Many of the models have also switch for analog/digital input etc...

Other choice might be one of NEC's earlier multisyncs, which supported 15.6 KHz, or maybe last series of Commodore's monitors for Amiga 1200/4000. I think that the name is C1940 (or C1942?).

Of course, none of these have microprocessor controll or memory to recall prerecorded settings whenever you change graphic mode, but this can be handled with a more or less few relays and a bit of electronics.

Branko

Afaik, this is caused by older versions of GEMDOS limitations
on hard-disk and partition sizes. Upgrading STacy to TOS 2.06
could help you in this regard. You might also want to install
BigDOS to add a few MS-DOS/ISO functionalities.

Hi all!
I've got a problem. One year ago I changed the systems from Atari, which I used because I'm a music-teacher, to PC. I wrote many MIDI-Files with my ATARI and I don't want to loose them.
Can anybody tell me, how I can transfer these files from my old ATARI 1040 STFM to my PC? I think that I can't use the floppy because of the different formats.
Thank you for help

Hi,

I must log into my ISP (Compuserve) before running DIALER
because the loggin script have to use 7 bits even parity
(I wrote a little GFA program for this).

So when I run DIALER, the modem is already connected (carrier is
present).
But I can't find a way to negociate PPP.

I tried to suppress INIT, PREFIX and PHONE_NUMBER from my DIAL.SCR
but that doesn't help.

Anyone have an idea ?

Thanks.

Jean-Michel MERCIER

The MetaDOS documentation is under the copyright from Atari. You might want to try to email somebody at JTS Corp. to find out whether they now allow to copy it freely.

Depending on what you need, you might also want to take a look at my freeware sample DOS driver (cookiefs on http://www.muenster.de/~reschke/soft_e.html).

Andreas, If the Atari disk were formatted 720K the PC should be well able to read the disks. Another way would be a file transfer via null modem between the Atari and the PC or a modem to modem link between them.

Hope this helps

No reason why you can't use the floppies. If you have TOS 1.04 or newer, you can format the disks on the Atari (no extended formats such as 82 tracks or 10 sectors per track) and the PC can read them. The other option is to format 730KB on the PC and the Atari can read and write just fine.

No, this has nothing to do with TOS limitations. TOS doesn't care at all
for the drive capacity. This is exclusively related to the ACSI bus
restrictions.

Thanks for that (and to Roger who also replied). It leads onto my next question; I now have a key switch on the front panel with nowhere to plug it into. Since I can't be bothered to hack together something with relays/contactors to switch the mains itself, I figure I could use the switch to actually disable the operation of the computer.

Half my mind says to find the HALT line on the CPU and use the switch to tie it low. The other half, however, wonders what the effects would be of tying the RESET line somewhere. More particularly, would any damage be caused by connecting the keyswitch in parallel with the reset button (as this is an easy place to connect to) if the machine is powered up for a "long" period of time (say 5 minutes) with the reset button apparently held in.

I suspect the CPU would be okay, but I presume the reset button is also connected to the reset lines of other bits of circuitry which could be affected.

All help or thoughts appreciated,

Xav

Read the fucking DIAL.SCR comments. It's all explained there !
Set SUCCESS to DIRECT, and leave the DIAL_SCRIPT part empty.

Alternatively, use the 'Port Setup' CPX instead of the Dialer.

I find that My Pc can only read files in the root directory of an Atari ST formatted Floppy. I found the best way to transfer data is to format the disks using Neopaint which produced 100% Dos formating. It is also possible to tranfer stuff to a power mac in this way. Though saying this the disk drive in my old Atari is now on its last legs and has to be warmed up for an hour before it will do anything.

This is normal for all Ataris with an ACSI (DMA) port, i.e. for those
Atari that don't have a full fledged SCSI bus like TT and Falcon.
Standard ACSI only supports drives up to 1 GByte. Drives with a higher
capacity can only be used with SCSI host adapters like the LINK96/97 or
the ICD adapters.

> What is wrong here? How can I correct the problem so that the full disc
> space is available?

You have to use a third party host adapter as mentioned above.

It sounds like someone has removed the ribbon cable from the back of the drive, and then plugged it back in upside down. The cable probably needs to be unplugged and twisted over and plugged back in again.

I had this problem many years ago when I upgraded the disc drive on an old STFM from single to double sided. Took about half an hour to figure out that I'd put it in the wrong way up, and boy did I feel stupid afterwards.

Hi there

I am in a small dilemma, and I am sure this question has been asked here before, so please bear with me.

I wish to have a hard drive which is compatible with the Atari, Mac and PC - the most important being the Atari and PC.

I have MagiC 5, MagiC-PC and HD-Driver - so what do I do. :)

The SCSI card in the PC is an Adaptec 1542C, and I wish to use my Syquest EZ drive with this and also connect an external hard drive - both of which I will want to use on the PC and Atari, at whim.

Any ideas?

How doe the mac fit in to this scheme of things?

Regards
Danny

Your best bet is taking it to someone that does this type of stuff. When I worked for Motorola I did SMD and the company bought a special maching to mount and un-mount this type of chip. Also I do not beleive that you can use a PLCC socket to repace the chip as if I recall right a SMD doesn't have the PC board drilled underneath it.

Actually a PC can read a Atari disc. The problem is that Atari uses a
Single sided disc and the PC wants a double sided. So unless you have a
drive on your Atari that is high density/souble sided my suggestion would
be to put all your Atari midi files in a zip file and e-mail them to some
one with a pc. Otherwise I'm out of suggestions. My solution was to buy a
Floptical drive some years ago on my Atari that reads and writes high
density floppies that pop right into my PC. The flopital drives work good
but are only available used if you can find one. they also hold 20 meg on
flopitical discs.

good luck

Hi

Is it possible to have STiNG/STiK use the TCP/IP parameters on a Windows 95 box when using MagiCPC? This would be a very useful feature for me as I now use ISDN on the PC for my comms - the PC is connected to an ISDN router via an ethernet card. I'd like to connect under MagiCPC using this set-up, rather than having to rely on the comm ports and a modem.

Is this possible?

Regards
Danny

This might be completely the wrong way to go about it, but I'd use a MiNT based system on your atari (What spec is it?), and set it up to act as a file server for the other two machines. MiNT replicates unix fairly effectively, and unix is a common system used for networking. Post any further questions on the group, since I probably won't be able to answer them.

Cheers
Gerard

IIRC there's a "DOS-compatible" option in HD-Drivers partition-dialog.

> How doe the mac fit in to this scheme of things?

I don't really know, but I know that people use their Zip-drives on the
Macs at school (the PC doesn't have SCSI) to transfer warez to their home
PC...

Thanx for your reply, Gerard - using Unix throughout is a good method,
but I wish to be able to swap disks between Win95/NT, Mac and Atari, when
I am using MagiC(Atari/PC/Mac) or in their native modes.

Anyone else got any other ideas?

Regards
Danny

So nice ! I should find a bigger font :-)

So nice, but I have a problem on my STE.

This works very well with MagiC PC, I now can connect STING with
Compuserve in a Win95 window....

But if I do the same on my MegaSTE, the Modem hangs as soon as I
run DIALER.APP !!!

I tried this either on the Modem 1 [MFP] port and the Modem 2 [SCC]
port. I have HSMODEM7 in my auto folder.

Masters help me !!!!

BTW, if another Compuserve members is interrested to test, I can give
my connection program to who wants it.

Thanks for any help.

Sincerely,

Jean-Michel MERCIER.

3377. How to get TOS2.06 rom or rom-image ? Legally if possible !

It really depends upon what you want to do I think. If you get MagicMAc
too then there should be no problems sharing data, MMac has no problems
reading my Atari ZIP disks or my Atari HD.

Greetings,

I'm trying to get a Cyrel Sunrise m16-1280 video card working in a
Mega STE for a friend of mine, but am experiencing problems.

To begin with, we have no printed manual, in the event that the necessary
information may be contained there.

Essentially, after following the installation instructions from the
tutorial program and continuing with the software driver installation, the
system displays 4 bombs and locks on bootup.

Any assistance or direction towards updated drivers would be appreciated.
Please contact me if you are using a Sunrise card.

Thanks!

A PC _can_ read a properly formatted single sided disk. The real problem is that very old ATARIs (the ones with single sided floppies) had a very old TOS version (like 1.0, 1.2), which doesn't format disks exactly as PCs do. TOS from 1.4 on and most utilities (Fastcopy, Ecopy etc.) can format a DOS compatible disk without any problem. However, things are not that easy. Windows 95 adds some information that is not compatible with the initial DOS specifications, so if you copy something from ATARI to PC on a DOS formatted disk, it will work OK, but not if you copy things through WIN95. Always use plain DOS on a PC to play safe.

Maciek Gornicki

3385. Curious Falcon Question

Hello All,

I know everyone is keen to get their Falcons out of the original cae and into a tower or desktop case with a separate keyboard, but actually I quite like the compact design of the original.

However I cannot stand the squishy slow keyboard - I thought I might get used to it, but after a couple of months of typos and missed characters I have had enough. I still have the external keyboard from my Mega ST and have instructions on how to connect it to the Falcon, but these assume that the whole keyboard will remain external to the Falcon.

My question is - has anyone replaced the keyboard unit inside the Falcon with a Mega keyboard? That way I would have the nice action of the Mega keyboard with the compact case of the Falcon and still have room on the desk to move the mouse.

Thanks,

Michael

I'm with you on the small case, and I too could not stand the Falcon keyboard after having been spoiled on a Mega keyboard. What I did was bought a little kit from Best Electronics called TT touch. What it is is replacement plastic cups (the little cups that sit under each key on the keyboard). An easy couple of minutes to install, and a cheap fix too. Now the feel is marvelous.

Hi!

I want to sell my Falcon with following components:

Hardware:
Falcon-TOS 4.04
32 MHz Skunk CPU-accelerator
4 MB RAM
548 MB SCSI-Harddisk (external; no internal HDD)
FPU 68882 Coprocessor (20 MHz)
BlowUP Video Extension (Hard 1) for High-Res.

Software:
MagiC 5 and 5.04 OS
MultiTOS OS :-)
Speedo GDOS 5
Ease 5 Desktop
Graoumf Tracker (32 Tracks)
lots of German Shareware (CAB 1.5, 7UP, ...) and tools for MagiC
some more Apps and about 300 MB of Free- and Shareware and PD

...and the price? You can have it all for DEM 800,- plus transport costs. So you best live in Germany or anywhere nearby :-) If you re interested write an e-mail.

Christian

MROS itself could be corrupted. Also the audio mixermaps could be bad.

CAF does alot more than AudioTracker so it taxes the system more.

Could getting a Nemesis help, well it works fine for me but I also have
an AB040. A properly installed Nemesis does have the best buffer mod but
as a general rule the max the motherboard can take with SCSI is a 20Mhz
bus.

Hope this helps,

Rich

>All help or thoughts appreciated,

It's very simple to chance a little capacitor in the near of
the original reset button:

Results:

Your machine will make a longer `powerOn Reset phase' if you
swich the machine on.

Next Way:

Use the PowerGood Line from the PSU (If you use a PC-PSU)

Regards, Robert

(I hope i understand your question well)

Yes, that's easy to use.
Place the case under your table (or somewere else) and only use
the monitor, the keyboard and your mouse on the table top.
What's the point?
Problems to replace the original Keyboaard with the MegaST-keyboard?
It's a simple connection..
(Don't chance +5 and GND !!!)

Regards, Robert

(After more as one 'Falcon into Tower/Desktop' transfers..) ;-)

(Don't chance +5 and GND while wireing the new keyboard !!!)

Source record: 15177
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,alt.steinberg.cubase

Greetings all..

I've been having some trouble lately running CAF.

Here's my system: Atari Falcon, 14 megs RAM (RAM gizmo board), ScreenBlaster, 2, NVDI 3.02, HDDRIVER 5.10, CAF 2.06, 1 gig Toshiba drive, 2.1 gig Seagate drive, STMIDI3, Steinberg S/PDIF interface (with 20 bit upgrade installed), SoundPool ADAT interface, Steinberg ACI, Fostex ADAT XT, CAFFIX.prg and FDIinit.prg installed, clock buffer mod installed, TOS 4.04.

Here are the symptoms (short version):

--A couple nights ago, I was working on some recordings, and CAF crashed on me. After that, CAF would not work right, although everything else seems to be fine. What happens is CAF 2.06 will load and play the def.all OK (without audio), but the moment I try to play or even access (through the audio pool) previously recorded audio parts, crash city, out to the desktop, and the cursor moves to the upper left of the screen once I touch the mouse. I also tried running 2.03 off floppy with the same results.

-I ran Diamond Edge which located lost clusters in caf 2.06, and restored it from backup, to no avail.

-I have tried booting up without an active auto folder, it doesn't make a difference.. the only thing running is HDDRIVER.

-Last night, I tried working with other HD recording software (Audiotracker demo) which worked fine. ADATREC.PRG worked fine.

-I downloaded a fresh version of CAF 2.06 and MROS drivers, and the same problems remain. This is obviously a CAF issue! I even tried renaming the def.all song with no luck.

Here's the deal.. could it be a clock buffer mod/SCSI issue? If so, would purchasing the Nemesis possibly cure the problem (I understand the buffer mod included with the Nemesis is top notch)?

Is CAF more sensitive to SCSI issues then Audio Tracker?

Does anyone have a clue?

-Mark

> as 82 tracks or 10 sectors per track) and the PC can read them. The
> other option is to format 730KB on the PC and the Atari can read and
> write just fine.

You can format a DD to 10 sectors, 82 tracks and windoze 95 will accept
that space as being there, but earlier versions of windoze seem to ignore
it and decide the disk needs to be formatted.
The only problem I found with doing this is that the copying from the disk
to the ST is made more complicated as I found under Neodesk that I couldn't
just drag n drop the drive to any folder, I had to create a folder and
manually select files.
I think this only occurs if you open the disk, or check the properties of
it under windoze, so just copy straight to it.
I did find a program which said you could connect the PC to the ST via the
parrallel port and transfer files that way, I haven't tried it yet, it is
buried in my HD somewhere.

Kev.

In article <3469F3BF.A6E1E86E@intuit.com> you wrote:
: --A couple nights ago, I was working on some recordings, and CAF crashed
: on me. After that, CAF would not work right, although everything else
: seems to be fine. What happens is CAF 2.06 will load and play the
: def.all OK (without audio), but the moment I try to play or even access
: (through the audio pool) previously recorded audio parts, crash city,
: out to the desktop, and the cursor moves to the upper left of the screen
: once I touch the mouse. I also tried running 2.03 off floppy with the
: same results.

We're having _exactly_ the same problem.

It started when we repartitioned our 2GB Seagate disc. Previously CAF was working correctly, but after repartitioning the disc it started crashing exactly as you describe.

This suggested that the problem was related to the disc in some way. But no matter how we partitioned the disc after this, the problem would not go away, it seemed.

After endless experimentation we have got it going again, although I don't know why. All I did was repartition it and suddenly it started working again. I don't how many times I had repartitioned before this happened! The trouble is this scheme that worked is 5x 400MB partitions which is not a good scheme (I prefer 2x 1GB partitions). But I'm concerned now to repartition again in case the problem returns. I also did have the problem go away occasionally at other times, but rebooting would bring it back again.

I don't really know whether the problem is in fact related to the disc partitioning. I suspect that it may have been coincidence, since the problem does sometimes go away and come back independant of repartitioning the disc. I'm wondering if it's a hardware problem.

There is another problem that I was observing before this all happened. When I first got the machine it was working very well, but since then this other problem has come into effect slowly. The sound sounds very distorted so that it cannot be properly heard when this problem occurs. To fix the problem it is necessary to choose the audio source again from the popup menu in the Hardware Setup dialog.

Then this crashing problem started happening, the same as what you observed. I wonder if this distortion problem was leading up to the crash problem.

I don't know if this is related to the problem, but with Diamond Edge 2, when I try to partition the disc or save the "SCSI info", Diamond Edge reports that it cannot read the root sector. I don't believe that it used to do this.

The other problem that I have observed is that sometimes one can record some audio, but when the audio is played back you can hear something totally different - even audio that has previously been deleted! Have you seen this problem?

There are several modifications for the Falcon, and we wonder if it may be necessary to try these. This is what we will be doing.

Please let us know if you find out anything further about this problem.

Format your disks on a PC at 720K not 1.44meg. These disks can then be
read and written to on the Atari and they will also read on a PC. PACMan

The problem might be that CAF doesn't support partitions > 512 MByte?
For standard applications the partition size and the partition
parameters don't matter. But for applications like CAF which come with
their own routines for hard disk access it can make a difference.
On the Falcon partitions up to 1 GByte with a logical sector size of
16384 bytes per sector and 2 sectors per cluster are legal. With these
parameters you can have partitions up to 1 GByte.

>
> Masters help me !!!!

Try this. Once connected, instead of running the dialer, open the port setup CPX. Click the 'Addressing' box and change to 'General'. Click on the PPP button and then click the 'Active' to activate it. There should be a bit of data sent too and fro while the PPP connection is negotiated. After that, finger crossed, it should be on-line using PPP.

One thing to note, I don't use Compuserve and this is all off the top of my head. I hope it works, but if it doesn't, try asking again. Someone else may come up with a better thought.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade. I need to test the Mega 4 ST before I pay. I was recently burned by an old friend who said the Mega worked. He couldn't refund my money. I can't afford to be burned like that again. Please do not reply here as I dont read message bases. Please direct your reply through E-Mail to bensmith@teleport.com or call Ben at: (503)256-9974.

P.S. I'd need to keep this transaction solely in the United States.

Replies Through E-Mail to: bensmith@teleport.com.

I'm looking to trade for these Items for my Atari. I'm looking for
CatBoxes for Atari Jaguar, Jag-Links as well as Jag Controllers, Alien
vs Predator and even complete Jaguar Systems. If you have what I'm
looking for, check my Atari Catalogs for stuff to trade at:
http://www.teleport.com/~bensmith/bscomputers.shtml or
E-Mail bensmith@teleport.com for a trade.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. So check out my Catalogs!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. Hardware
specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141
Monitor, Atari 1050 Disk Drives, Atari 1050 Happy Drive, Indus GT Smart

Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads,SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST & Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is.
E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974.
Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Er, what?

Do you mean STonX? (ST emulator that runs under X-windows/unix - including
SunOS etc.) Its freeware - try:
http://www.complang.tuwien.ac.at/nino/stonx.html

This of course contains more than just the CPU emulator (actually, I
think its up to 030 now), but you could probably pull it out of the source...

> buffer mod included with the Nemesis is top notch)?

If it worked before and audiotracker works I wouldn't suspect this.

> Is CAF more sensitive to SCSI issues then Audio Tracker?

I wouldn't think so. Maybe the DSP has blew? Have you tried another
program which you knows use the DSP like Bad Mood, any MPEG player
or something else?

It sounds like it could be the DSP which has "melted".

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

FIRST THE SOFTWARE:

1. IMAGECOPY 4 CD $17 (converts between Jpg, Gif, Tiff, Img. You can even print. It's a very clean application.

2. TRUEPAINT V 1.02 $19 Excellent drawing program; all resolutions and colors. Works in ALL ataris. From B\W. to true color.

5. PHOTO SHOW 1.0 by It's all relative: Create multimedia presentations audio-video; Also watch kodak photo Cd's in PCD format. This prg. will go with PCD sampler vol CD-ROM $20 (Falcon)

6. MIDI QUEST 4.0 $25 (Synthesizer sound editor) I have file list , will send upon request. Works on Falcon also.

7. STALKER 3.04 $19 Get connected with this reliable terminal program up to VT 220. A wide range of setups. All Ataris. Interfase with Steno(see Steno) excellent XYZ modem transfer module. Works as a prog. and Acc!!

8. STENO 2.10 $19 Interfaces with Stalker: You can cut, copy and paste from one to the other. Also Works like Prg or Acc; you can even run it as many times as you want and you will have the "copy and paste" option between them.

9. PAGESTREAM V 2.01 $20 Excellent DTP prg. Box with comprehensive documnetation.

10. CALAMUS $35 seven disks. The Ultimate Atari DTP prg. From making of complex DTP documents. It comes with several modules.

CD ROMS: Both CD roms can be read by a PC also, format compatible.

11. GEMINI Atari thousand of shareware and public domain prgs. $11
12.CRAWLY CRYPT collection V. 1 more public domain and shareware (even Falcon).$11

HARDWARE

14. Atari SM 124 excellent condition: $20

15. Intel External 144e (14.4Kb) FAX/MODEM with cable for Atari $43. (has original sotware PC)

16. Beetle MOUSE $15 This one does not need accelerator software to run fast and accurate. Nice red color and easier to move around than the classic one.

17. FALCON 030: 4 MBRam *Tos4.04*IDE 85MB*WITH SREEENBLASTER AND MATH COPROCCESSOR, ready for Cubase Audio (was running CAF!) since the Analog in-outs were modified according Steinberg's suggestions. All ports work. It has had not too much use and it's full setup to go. Currently I am using it with an SVGA and/or SM 124. Hard disk does NOT have bad sectors. It boots up fast and runs great.

Play movies MPEG, see GIF's and JPG, etc, in true color. Record to hard disk up to 50Khz/ stereo, (add effects to your recording also) using the software included (Direct to disk -IDE also), see multimedia animations from the net (for Falcon), have a blast with it! :-) This is the PERFECT upgrade if you have been using Atari.

The OS (TOS 4.04) is much more stable than the one found in early models :) (No offense! -but it is true!-) The SCSI 2 interfase rocks. Works like a charm and will allow to plug into every SCSI
device you want to use. Be welcomed by multicolored icons and the easiness of a 1.44Mb. drive. Man! it even has a little speaker built in! fully controlled by software.:) $ 550

Free stuff:
Modem 1200 internal
Atari Ste language disk English-USA CA 400607-001 Rev B
Ultimate virus killer UKV 5.9

If interested send ZIP code to ask UPS for charges. I am willing to go down in the prices if you buy more than 2 items. For software with light weighted documentation, I can send it for $3.00 priority mail. Regards, Phil.

There is a utility called msfdefrag that does this, but I have never tried it.
I usually find it faster and more reliable to "defrag" partitions by copying
it's contents to another partition, clear the partition and the copy the
contents back.

From: ddc@imaginet.fr
Message-ID: <64lvlvhat1@belzebul.imaginet.fr>
Source record: 15098

Hello to all,

I have a MegaSTE, with an ET4000 NOVA card. I have no problems running this with the NOVA VDI 2.61 drivers. I am now trying to install NVDI ET4000. The problem is that I do not know how to begin. The NOVA VDI drivers come with standard BIB files, from which you choose your resolutions. In a similar fashion, NVDI ET4000 uses NVDIVGA.INF files, but do not provides them.

A program is supposed to be able to produce them (VMG), but I had no success at all with it. First it is in german, second it has no documentation and, worst of all, it asks a lot of technical information about my monitor, which I do not have. I bought my monitor second hand, so I do not have any documentation with it. It is a Commodore 1960. All I know is that it is a multi-sync, capable of doing all the standard ST resolutions, and that it can goes above 800*600 16M.

So to get me started, I am asking for someone with a similar setup to send me a basic NVDIVGA.INF file.

By the way, if someone have the specs for the Commodore 1960 (I know this is an Atari group :)), I would be pleased to have them.

Many thanks in advance,

Didier BRIEL

This info is in my Quick FAQ. Basically, there are no plans avilable for
building a SCSI host adapter (these include some PALs and can't be
bought seperately), but you can buy one from most Atari dealers.

3417. Help! Mega 2-ST Keyboard, Bus, and Thingy

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-17 00:00:00 UTC
From: ad329@james.freenet.hamilton.on.ca
Message-ID: <64qdg9$9te@james.freenet.hamilton.on.ca>
Source record: 15102

On a recent trip to the Goodwill I managed to pick up a Mega 2 ST for only
$15. (I've picked up a half dozen STs this year for $5-$15 each)

The only problem with this unit is that it lacks a keyboard.

Can someone explain to me how I could either...

Modify a PC keyboard (need to add joystick ports too) to work with the
Mega 2 ST. Or hook one of my spare ST keyboards up to the beastie
(I'll have to build some sort of case for it though).

Or direct me to a webpage that will tell me how to do this.

Also... I'd like some information on the wierd bus that is inside the machine
What is it, and what can I do with it? Is it for a hard drive?

And I also noticed what looked like some sort of handmade modification to
the machine. A little circuitboard that sits on top of the CPU. Was this
native to the design, or does it sound like something someone added later.
Any idea what it does?

It'll be nice to get this beastie up and running to replace the 1040ST I've
been using for MIDI work.

I tell you, with all the STs showing up in Salvation Army Stores, Goodwills
and Value Villages, there's never been a better time for getting STs cheap.

CRACKERS
(A Flock of STs from hell!!)

DOITF03H.ZIP, but it's mostly in german. (And more Falcon relevant)

If you have an ST?

First you need an DMA to SCSI-Adaptor. LINK97' ICDPro or what ever.
At the open end ot that adaptor you found a SCSI Bus.
That's the port to connect a simple SCSI HD Device.

A nice HD-Driver is HDDriver7.x

If you bought an Adaptor, also you found some informations in
the manual. It's very simple. Send a message if you have more questions.
(Sure, your new SCSI-Device needs a case and a PSU)

Regards, Robert

If 1stGuide can show them, they are probably "progressive" JPEG's.
Whatever that means.

3421. Can Civilisation be played on an STE

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-18 00:00:00 UTC
From: "K.HAIGH-HUTCHINSON" <khaighhu@nospam.bradford.ac.uk>
Message-ID: <3471765C.A75@nospam.bradford.ac.uk>
Source record: 15106

My husband has a MegaST with 4 Mbytes of RAM, TOS 1.4 I think. I enjoyed playing Civilisation on it.

Now he uses an STE TOS 2.06, and the Game does not work. Sometimes it giveds 6 Civilisation advances at the start and then does not allow any more to be made

There is another STE TOS 1.6 I think, floppy drive only. I tried to play the game on that. It appeared to work, but when I was the most happy, most wealthy, most powerful Civilisation, and I learned absolutely nothing from the Great Library and no one attacked me (I did have the Great Wall), but it did appear that the other Civilisations just weren't playing.

Has anyone got this game to run
a) On an STE
b) with TOS 2.06

Has anyone any suggestions as to what is going wrong?

Kathy HH

> Whatever that means.
It means that the pictures are displayed in "hops". First, you get a
very rough overwiew of the picture, which improves in steps until you can
see the full quality picture. It's a bit like interlaced GIFs and is
useful for WWW-pages as the user gets an impression of the image even
when only small parts have been loaded yet.

Ciao

Thomas

It is a direct CPU connection. It was used for a few expansions, like a
floating-point coprocessor and a couple of graphic cards.

This is probably the original daughterboard Atari added after they
discovered a lot of Blitters were flaky in the Megas. I'd suggest you
leave it there.

It's not weird ;-) it's the Mega Bus, a processor slot that allows fitting
special hardware, like network cards or graphics cards. It's not for a harddisk.

> And I also noticed what looked like some sort of handmade modification to
> the machine. A little circuitboard that sits on top of the CPU. Was this

It's a little bugfix that corrects timing of the blitter IIRC. Made by Atari.

2.06 is not renowned for liking some older games although I've never
heard of any problems with Civilization myself. On the other hand,
most people who have upgraded to 2.06 tend to have a switchable
upgrade so they can revert to 1.62 if required.

There is an editor. You might find this useful just to confirm what
the other civilisations are up to. iirc, it's called CIVPATCH
(german).

>Has anyone got this game to run
>a) On an STE

Yes.

>b) with TOS 2.06

Not tried but it does run fine (singletasking) under MagiC on a 4mb
ste.

>Has anyone any suggestions as to what is going wrong?

When I had it installed on my hd under tos 1.2 and 1.4 on my stfm it
used to suffer from periodically corrupted files. Re-installation was
the cure.

>more to be made

I haven't had too many problems playing it on a MegaSTE with TOS 2.06.
It does crash ocasionally though, especially when I run it at 16 mhz with
cache.

>There is another STE TOS 1.6 I think, floppy drive only. I tried to play
>the game on that. It appeared to work, but when I was the most happy,
>most wealthy, most powerful Civilisation, and I learned absolutely
>nothing from the Great Library and no one attacked me (I did have the

>playing.

Every once in a while my original copy did this too. I don't know what
causes it. There are a few different version of Civ out there. A few years
back I contacted Microprose about this. I sent my original disks back and
I haven't had the problem since. It still crashes ocassionally though.

Hmmm, intrigueing. I've been following the Atari NGs. for some time
and never heard of this board , much less a company called C't . Could
you enlighten us further ?

> "Augeas"

They could be progressive JPEGs. Try loading them with 1STGUIDE and see if
it fills it's mouse pointer several times. It normally fills it once, one
segment at a time, before displaying the picture whereas it repeats this
operation several times before showing it on screen.

There is a program that will convert a baseline (normal) JPEG to the
progressive format, and possibly back, included in the JPEG v6 archive.
The only problem is, I've only been able to find the source code archive and
I can't compile it. I'm waiting for some kind soul to do it, since I don't
have a C compiler that can compile it.

You mean the 'jpegtran' utility.

Be patient!
IJG v6b will hopefully soon be out, and as a new member of IJG I've also
taken over the Atari port.
It is currently in final Beta stadium (available in source form from the
private IJG archive at columbia.edu if somebody cares), and I will provide
the Atari binary package as soon as Tom Lane makes the public release.

Like the current version 6a, it compiles straight with Pure-C on Atari systems.

v6b will provide some enhancements, particularly in 'jpegtran' :-).
You may look at http://www.reporter.de/jpeg-lab.html to get an idea.
You can also use this page to convert progressive JPEGs to baseline
losslessly (works fine at least with Netscape)!

Hold an eye on the JPEG-FAQ (http://www.faqs.org/faqs/jpeg-faq/),
particularly part 2 section 10, for upcoming download places...

Regards,
Guido

See my corresponding post in another thread.
You can use 'jpegtran' from v6(a/b) IJG distributions to convert
progressive JPEG losslessly to baseline JPEG or other file formats.

The Atari Quick FAQ (http://wwwperso.hol.fr/~nbales/quickfaq.htm) says
that you can transfer data between an Atari and a PC using a parallel
cable but the URL for the one that appears to be most useful (HDD
Daemon) doesn't seem to work any more.

Please help I have a problem connecting this old BT modem to the phone line for my father. It must be possible... If i am testing it what is a good package to use to see if the modem is working? A terminal program?

DATEL Modem 4192 AX
(19200bps)

Only have serial cable - no others. How to connect to phone line? No dialling tone but lights on modem. On BT line only 3 wires are connected to plug. Line connector cable would be BT plug at both ends (unlike regular modems BT plug and RJ11 plug).

Large A4 size slab shaped 'switchboard' modem,

Front of box lights: buttons:
RTS RFS CD RD DSR TEST AL ST RDL DL 2400 4800 9600 19200

Back of case sockets:
DTE(serial) TELE* PSTN* PC* POWER(240V)
* BT type sockets with 6 connectors

"DEA 2000021 Ground Floor" printed underneath with BRITISH TELECOM embossed on base as well.

Any ideas?
Anthony

I'm aware of this. The URL is gone, it was somewhere in tchecoslovaquia
(.cz), but I had never heard any comments from other people about it.

I seem to remember seeing the the archive somewhere else (the Fuji
Archive maybe : 128.120.234.42, or the good old lip6 archive)

Otherwise, you can use ParcP which is more reknown, I've heard quite a
few people using it, or go for ghostlink, which is serial, but mounts
the drives on the desktop.

Network cards.... hmmmmm, this has possibilities. I've got a network card
for my PC here somewhere, if I networked it to my Mega-ST I'd be able to
access the CD-ROM and Hard Drive from the ST.

Where can I get one of these cards and how much?

CRACKERS
(Sounds like a plan from hell!!!)

>There is no way to do exchange data between PCs and Ataris using the
>parallel ports.

Of course there's a way to exchange data between two computers using parallel ports. Actually there are several programs for doing this: PARCP, HDD Daemon and ST-Trans. ST-Trans was written by Atari and works between two Atari computers only. HDD Daemon was written by a friend of mine and works between Atari and PC only. PARCP is developed by me and works between any two computers (ie. between Atari and Atari, Atari and PC, PC and PC).

The last version of ST-Trans known to me is 1.05. HDD Daemon is up to version 3.0, and PARCP is at 2.79beta.

PARCP is located at ftp://ftp.zlin.vutbr.cz/pub/atari/parcp. Its homepage at http://ft3.zlin.vutbr.cz/stehlik/parcp.htm is temporarily offline (due to hardisk crash on a server), but you can use a mirror of my WEB pages at http://www.cyberstrider.org/mirrors/stehlik/

I don't know any concrete locations of the other programs.

Petr

Are you sure Peter?

There is PARC (PARallel Copy) that will couple an Atari and a PC (or any variation) via the parallel port, tho' it is not a networking system.

Speak to 'ya later!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. Hardware
specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141
Monitor, Atari 1050 Disk Drives, Atari 1050 Happy Drive, Indus GT Smart

Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads,SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: Spectre GCR Macintosh Emulators, Color & MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST & Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II & Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is.
E-Mail: bensmith@teleport.com or call Ben at: (503)256-9974.
Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you test JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such as the 1090XL expansion Box. I got it from The Shadow of Shadow Software. It is the Best one of the Few that Atari made. And the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Go to: http://www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Looking for an Atari Mega 4 ST. Please, no upgraded Mega 2's. I need a stock 4 MB Machine Plus a TOS 1.4 upgrade. I need to test the Mega 4 ST before I pay. I was recently burned by an old friend who said the Mega worked. He couldn't refund my money. I can't afford to be burned like that again. Please do not reply here as I dont read message bases. Please direct your reply through E-Mail to bensmith@teleport.com or call Ben at: (503)256-9974.

P.S. I'd need to keep this transaction solely in the United States.

Source record: 15139

perot to All (17 Nov 97, 22:41:59):

p> In article <346C2ECF.5005AC6@tu-bs.de>,
p> Matthias Fischer <M.Fischer@tu-bs.de> writes:

>> Hat jemand Erfahrung im Datenaustausch zwischen PC und Atari ueber
>> Nullmodemkabel -- welche Software ...

p> There is no way to do exchange data between PCs and Ataris using the
p> parallel ports.

Wrong:

```
===8<============================================================
PARCP250.ZIP 475K 30.06.97 [004] PARCP 2.50 - fast PARallel CoPier. Works
between two computers on their parallel ports.
Supported are Atari (TOS/MiNT/MagiC) and IBM
(DOS/Linux/OS/2 and Windows95).
===8<============================================================
```

I haven't yet tested it, though.

p> You can of course do it using a null modem cable on
p> the serial port. There is a number of packages available.

E.g.:

```
===8<============================================================
GHOSTLNK.LZH 25K 3.01.95 [020] GhostLink, ein Netzwerk zwischen
ATARI-Rechner und PC ueber Nullmodemkabel
===8<============================================================
```

This allows you to access the PC's harddisk from the Atari. However, the PC program only works in DOS and thus one may not be able to use the PC even though one's got a multitasking system. (I'm using it with an old 286 here, so no multitasking there.)

Unfortunately, I cannot offer a ftp address. For FidoNet or NeST nodes: try 2:2454/95 (V34+) or /950 (ISDN) resp. 90:400/601, or on-line: Int'l+49-261-54953.

Ciao,

Florian.

Sorry Peter,

you CAN exchange between ATARI and PC using Paralink2000 or parrallel
copy :)

have a look at ftp://ftp.lip6.fr/pub/atari/Telecomm/parcp250.zip
I don't remember the url for paralink :) sorry

[...]
LW> Hmmm, intrigueing. I've been following the Atari NGs. for some time
LW> and never heard of this board , much less a company called C't .
LW> Could you enlighten us further ?

"c't" is no company, it is the name of a magazine (abbrev. from computer [and] technology) from Heise publishers in Hanover, Germany. They also publish a magazine called "ix" for Unix machines and derivates, both in German language.

AFAICR they do not sell PCBs etc. themselves but through a company named eMedia, located in Stuttgart, Germany.

Ciao,

Florian.

> compatibility etc ?

Most SCSI-drives will work fine, but the host-adapter in the Power Drives (ICD Advantage ST) doesn't support parity so you must get a drive where parity can be disabled. You can also build your own parity-generator, it consists of only one cheap chip and is fairly easy to install (www.stud.ntnu.no/~josk/atari/).

And I don't think it's possible to use drives larger than 1Gb on the ACSI-port.

3462. Atari MegaFile 30 upgrade?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-22 00:00:00 UTC
From: Don Walterman <dwalterm@ix.netcom.com>
Message-ID: <6573me$82t@sjx-ixn6.ix.netcom.com>
Source record: 14998

I am looking for upgrade information on the MegaFile. I read that I can install a st277R to upgrade to 60 Meg. Do any larger RLL drives work? There is a second 20 pin header inside the
MegaFile. It looks like it was intended to support two RLL drives. Does this work? Does anyone
know what the internal jumpers are for (not the address switches)?
Thanks,

Don Walterman

If you buy a SCSI adapter for your STfm named The Link 97 or 2
Then you can use any SCSI Harddrive you see in PC or Mac magazines.
I think anything up to 4gb.
```

Thats the best way to do it.
Or you can have a look for old ASCSI drives.
I got a 250mb for £40 the other day,but its noisy!
SCSI is a better bet.
You can also use removable media such as ZIP,Jazz,Syquest etc.

You can indeed upgrade to a 65 Mb RLL drive and install a second one.
Seagate ST-177R-1 or ST-277R are suitable replacements.

Found in CHIPS350.HYP:

Retrofitting a 2nd drive in a Megafile 20/30/60 or SH205

Material:
1 34 Poliges ribbon cable(?) about 30 cm long
1 20 Poliges ribbon cable(?) about 25 cm long
1 V-cable for the Stromversorgung
1 Flachbandbuchse 34-polig to the aufquetschen
1 Stiftleiste 20-polig to the einl�ten

SH205 / Megafile 20

The modification as at the top described implement(ed), merely the resistance
and the strip conductor need not removes\ed i.e.. become durchgekratzt.
This measure is merely with the RLL-Controllern from the
type Megafile 30/60 required.
In the SH205 and Megafile 20 will(_be) a MFM-drive with ST412/506
BUS needs.

Megafile 30 / Megafile 60:

All cable to the hard drive abschrauben and then the disk
umdrehen. If the disk is turns\ed around, all messingfarbenen
Schrauben now delete and on the best to a Magneten put, then
rollen it not away. Now the disk again umdrehen and the Geh�usedeckel
after at the top abnehmen, then with a Spitzzange complete
Blechlaschen geradebiegen and then the Blechk�fig after at the top to
wegnehmen. Now the two Schrauben of the mains adapter rausdrehen and

to the Magneten put, following the Netzteilkabel to the circuit board
rausziehen and then the mains adapter rausnehmen and aside put.
Now the disk again to the head put and the four silbernen
Schrauben of the built in Festplattenlaufwerks rausschrauben.
The hard drive keep hold of and all again umdrehen, now the
Anschlu&#65533;kabel to the disk remove and weglegen. The silberne
Schraube,that the small LED-circuit board to the Frontseite held , must
still become removes\ed, as well as the small Schraube in the closeness of the L&#65533;fters
still is to remove. Then can one the whole(ly) Controllerplatine
from the front anheben and after from the front wegziehen. On the underside of the
hard drive locates\ed (self) a resistance-Array, (of)this is to the
old (original) hard drive to remove. On the new hard drive
must a resistance-Array be available, with it the Busabschlu&#65533;
correct is ensures/ed.

On the Controllerplatine now the L&#65533;tpunkte of J1 with a Entl&#65533;tpumpe
freilegen and following the 20-polige Stiftleiste einl&#65533;ten.
Then R19 to a page rausl&#65533;ten and wegbiegen or complete(ly)
remove. On the underside goes of pin 18 a strip conductor
direct(ly) to a through contacting to the circuit board, this strip conductor
durchkratzen.

Now the Controller again in the Blech put and in the case put in,
then the internal available hard drive again put in and
festschrauben and the small silberne Schraube in front of the L&#65533;fter not
forget. The 34-polige Flachbandbuchse auseinanderbauen and circa
15 cm of the Platinenbuchse removes\ed draufquetschen. First the new
socket now to the first disk draufschieben, then the Platinenbuchse
to the Stiftleiste draufdr&#65533;cken and now the still free(ly) 34polige
socket to the new, second hard drive aufschieben. The short
20-polige ribbon cable(?) to the Stiftleiste with the indication J0
aufstecken and the other end to the first disk aufstecken.
The new 20-polige ribbon cable(?) to the Stiftleiste with the indication
J1 to the Controllerplatine aufstecken and the other

weiterbl&#65533;ttern

end to the 20-poligen connection of the Zweitplatte aufstecken. On
the new Zweitplatte the Jumper of DS0 to DS1 umstecken. The VKABEL
to the Stromkabel aufstecken, what of the circuit board comes,
and then the two free(ly) Abg&#65533;nge to the Stromversorgungsbuchsen
every(one) hard drive put. Ever\y after Abmessungen of the second drive
must (of)this still become befestigt, what through the not standardised
Befestigungspunkte every self be left will(_be). The Befestigungspunkte
of Seagate and Nec are right actually agree, however have
the TEAC, Tandon -Western Digital disks again other Einbaurahmen
as\than too Befestigungen. It stays from there every self be left,
as it the removes. Then can the mains adapter again put and
become festgeschraubt. Who the Abschirmblech again building in want,

must with a Blechschere to the Frontseite something abschneiden,
other fitted the Blechabschirmung afterwards not more on it.

In the Megafile 30/60 will(_be) a RLL-drive with ST412/506 BUS needs.

If the hard drive(n) not more hochf�hrt and only a Click
or pipes to vernehmen is and both LED's to the Frontseite to it
aufblitzen, is either a short circuit the cause or a
�berlastung of the mains adapter in the game.

Attention: The Atari harddrive driver AHDI supports\ed (the same in
what version) fundamental(ly) only A hard drive BY Ger�teaddresse.
The only harddrive driver the TWO hard drives BY
Ger�teadresse support are the CBHD (from the book oh sugar!
2) and the HDDRIVER of Uwe Seimet (Uwe_Seimet@KA.MAUS.DE).

3471. Hard-disk FAQ ??

Newsgroup: comp.sys.atari.st.tech
Date: 1997-11-22 00:00:00 UTC
From: q-funk@citenet.net
Message-ID: <656uheahd1@cti01.citenet.net>
Source record: 15007
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Can I use a Syquest EZ-135/Jaz/ZiP drive on an ST?
Can I read/write BigDOS/FAT32/VFAT/Win95 on Atari?

Since Uwe Seimet provides intelligent answers to all the above,
I was wondering if he would care to prepare an "Atari HD FAQ"
and make it available on his homepage?

I would gladly put a link to such a FAQ on FUNKYWARE (and
upgrade to HD-Driver 7.0 if it was still sold in Canada).

***

Speaking of HD-Driver, I notice v5.13 does not recognize an EZ-135,
even though the utility to parse the SCSI chain that's included does.
However, good old (read: outdated) AHDI 6.05c manages to find it.

Any ideas why, Uwe?? ;-)

One thing I forgot to mention:

since you're starting from a MEGAFILE 30, it would be wise
to put a larger power-supply before upgrading to 65 MB. It
becomes even more important if you intend on fitting a 2nd
drive into the case.

MEGAFILE 30/60 Part list from CHIPS350.HYP:

Ersatzteil-Teilebezeichnung

C103166 = PCB Megafile 30/60 Controller (SE200346-001)
C101740-001 = PAL-ACSI
V101727-002A = OS-Epromchip
AIC-300F = Adaptec
AIC-010F = Adaptec
CXK5816PS-15L = SRAM CMOS 2K*8 Bit, 150ns Zugriffszeit (Fa.Sony)
P8085AH = CPU
TMP8156P = I/O Ram, Timer (Fa.Toshiba)
32D5321-CP = Chip U12
CA200086-001 = Power Supply Unit for Megafile 30
C103250 = Power Supply Unit for Megafile 60
Seagate ST238R = Seagate ST238R (30MB) Harddiskdrive
4 Heads, 615 Cylinder, no Autopark

```
MSB5064 = Miniscribe (61 MB,60 ms) Harddiskdrive, no
Autopark - Kein Aufkleber oder MSB xxxx,
6 Heads, 809 Cylinder, 26 Sectors pro Track.
MCS5068 = Microscience (64 MB, 24 ms) Harddiskdrive, Autopark
Aufkleber MCS xxxx,
5 Heads, 1024 Cylinder, 26 Sectors pro Track
SEA5065 = Seagate ST277R (63 MB, 28 ms) Harddiskdrive,
Autopark - Aufkleber SEA 5065,
6 Heads, 820 Cylinder, 26 Sectors pro Track
SEA5068 = Seagate ST177R-1 (63 MB, 28 ms) Harddiskdrive
Aufkleber SEA 5068, Autopark.

Some IMP brand DMA chips show ramdom errors under load. Perhaps your other hard drive does not pull down the signal as much.

3474. Re: Atari MegaFile 30 upgrade?

Newsgroup: comp.sys.atari.st.tech

Any RLL should work if you can write a wincap file to support it, or have other HD software with support for the model. I think I heard about the Megafile supporting two HD's, but don't know the specifics.

3475. Re: IDE for STF

Newsgroup: comp.sys.atari.st.tech

Titan Designs also has an IDE board (visit their homepage at Compuserve (www.ourworld.titan or something like that I believe), but it is expensive, and I was hoping for a hardwire project.
